bit of kit available here which analyses the Data part of the cell txmssn.
Its basically a portable pc with a scanner built into it. Its not cheap
though (about 25,000) uk pounds !! I don't think i'll be getting one !

Yes. I remember a post regarding how in England (where there is a TV tax!),
government officials monitoring IF freqs in an attempt to find people illegally
monitoring TV broadcast signals without paying the tax. I've also heard the
Nielsen rating people do the same to get more accurate samplings.

I've heard that an antenna can actually 'rebroadcast' the scanner's IF stages.
Is this true? I am curious about this.

This week on Spectrum we will scan the skies. Our guest will be our own
Gary Bourgois (The Birdwatcher). Gary is an expert on the world of
satellite tvro systems. Lots of folks enjoy his features on Spectrum,
but never before has he been live on the show to answer your satellite
and space related questions.
--
Spectrum airs live Sunday at 0300 UTC (2200 EST Saturday) on:

WWCR, 5810 KHz, Nashville, TN (World Wide)
WIFI, 1460 AM, Philadelphia, PA (Philadelphia Area)
KHNC, 1360 AM, Denver, CO (Denver Area)
Omega Radio Network, Galaxy III, X17, 5.8 MHz WIDE audio. (Satellite)

Spectrum is rebroadcast:

Sunday at 1500 EST, on WIFI, 1460 AM, Philadelphia, PA (Philadelphia Area)
Monday at 0400 UTC (2300 EST Sunday),
on WWCR, 7435 KHz, Nashville, TN (World Wide)

Source record: 276667

I agree that these laws are ridiculous or worse. I have written to my Reps in congress several times on other issues. The type of answers I've received to these communications is usually a form letter that states what their view is and why but not acknowledging my view. Typical political rhetoric. I have never received a response that satisfied me. The only way to get their attention is to have volumes of letters from volumes of people all voicing similar opinions.

I also see a bigger picture here too. I see rights being chipped away and an apathetic attitude from what seems like the majority of the citizenship allowing it. If you take a way the weapons, the right to listen to what YOU choose, and take away the money(taxes) you end up with a bunch of sheep wanting to be lead by people who only tell you what they want you to hear. This is probably a bit of an extreme statement. However I find it frightening in that it is happening in little ways. Unless we band together to voice our views and impose our united wills on our congress and other government officials I fear that our freedom will be severely restricted. WE DO HAVE THE MEANS GRANTED BY THE CONSTITUTION TO CHANGE THIS MESS.

I've probably said enough for now... Thanks for listening.
These are my own opinions and no one else's and every one is entitled to their own...

>I make a cellular mod to it?

Doubt it. I do it all of the time and customs can see it plain as day as it is mounted in the car. But after next month you may have a problem if they know that it is cell capable and view you entry with it as importation. Don't know about that.

Even better, any kid who goes down to the toy store and picks up one of those $10.00 pairs of walkie talkies can monitor cordless phone conversations. In fact, my son could not only hear but he could also talk on the cordless phone at my mother-in-law's the last time we were up there. It was a bit funny because he could only hear one side of the conversation and when he talked only one of the two could hear him (and I don't remember which was which) but it worked great. So, the FCC is now going to make it illegal to own a walkie talkie from "Toys R Us"?

1513. Update on Cellular Data Decoding unit

Newsgroup: rec.radio.scanner
Date: 1994-03-02 18:51:17 UTC
From: egurney@vcd.hp.com
Message-ID: <CM1wDH.FLp@vcd.hp.com>
Source record: 276670

The latest (February '94) issue of Nuts & Volts Magazines mentions the revision "D" of the "Cellular Surveillance Instrument" (CSI) reviewed in the August '93 issue. According to the article, the new CSI incorporates far more advanced electronics for signal processing and data decoding, and there is a *rumor* that additional software will eventually be available to allows the CSI hardware to decode various pager data formats as well as possibly unencrypted Motorola mobile data terminal (MDT) transmissions. Those are future possibilities, however.

The biggest change in the CSI is that in can be used not only on the North American AMPS cellular system, but also TACS and ETACS used in Europe, the Middle East, Southeast Asia, Hong Kong, etc.

On the hardware side, the radio control cables are now consolidated into one cable. For law enforcement and investigative use, the CSI has an integrated control relay and jack for activating a recording device. Other upgrades include on-screen DTMF decoding from voice channels and the ability to scan and display the signal strength of control channels.

Special RECC software is available that can display the ESN of a phone as well as the manufacturer's name. For security reasons, this software is available to service shops only upon verifiable authorization from your local cellular carrier or for law enforcement use. Full information on the serial number decoding is available in the product literature, available for $3.00 via mail or free via e-mail.

The CSI is available for US$484.00 (overseas US$529.00), including power supply, cables, specific kit for your radio/scanner, and shipping.

For more info, write: SPYTECH, 65 - 31 Avenue South West, Calgary, Alberta, Canada, T2S 2Y7. Their e-mail address is bill.fischer@t800.cuc.ab.ca.

DISCLAIMER: I don't own one of these, I have no financial interest in SPYTECH or any related business, never seen one in person, etc. I just thought I'd update the net since I posted about the unit back in August and a lot of foreign readers can't find N&V...

As early as the late fifties the British secret service was able to know what frequencies were being listened to by enemy receivers by tranmittig a pulse up and down the spectrum until the IF of the enemy receiver was distorted. Voila!

Read all about codname 'RAFTER' in SPYCATCHER by Peter Wright, a book that I believe is currently banned in Great Britain.

There's an interesting article in IEEE Spectrum, Feb 94, pp 21 about consumer devices emiting EMI aboard aircraft. Many horror stories about passengers operating TV's, CD players, portable computers and the consequences.

Quoting the last paragraph:
``Meanwhile, evidence for instances of interference due to operation of electronic units remains scant, incomplete and inconclusive. To fill out the picture, RTCA is disseminating a reporting form to the aviation industry. The form, which is voluntary and confidential, can be obtained from the organization at 202-833-9339.''

Obviously, they're not reading this net ;-)

>

As hot as available! a 35 to 45 watt pencile is best.

Weekend tech's say to use low heat, however, this warms
a larger area of the board and components and continues to
conduct heat into components for a minute or two after pencil
is removed.

This is how weekend tech's 'lift' traces off boards!

I found using highest available heat to quickly melt and
minipulate the local area then immediately appling -62,
or any freeze spray has the best results.

Get in and out. The operative word being 'fast'. Hot heat
is faster then slow heat.

This method applies to most soldering work including metal
shields and (espically) tiny surface mount components.

Solder wick works better then a sucker bulb since there is
not usally a glob of solder on a surface mount board.
Of course, a weller desoldering station beats them both.

This is IMO, of course, your milage may vary wildly.

I always thought they might take that chunk from 470-890 MHz, since "everyone" has cable TV these days, anyway. Why would they need world bands for personal communications devices?

> Maybye it holds the repeater or something,

Since we're throwing in speculation, I'll add my two best guesses.

1. The tones are an administrative tool which continuously alert officers that high-priority traffic is on the radio frequency and certain types of communications are prohibited (sort of like going to DefCon 2 :-)).

2. The tones do for the officers exactly what they do for camter28. If the police radios are equipped with a scanning mechanism, this may lock radios scanning that frequency onto that frequency. Sounds like an annoying way to do that, though, since actual audio isn't needed to hold the radios.

Just guesses.

Cheerio!

I bought a Radio Shack scanner antennna about a year ago that works
very nicely, especially with VHF-low, i.e. Highway Patrol and cordless phones.
I dont know the model number right off, but this is the popular magnetic-mount
antenna with two loads. It is about three feet long. The antenna is nice
because I can just remove it and throw it in the trunk when I dont want it to
be seen. It also works as an indoor antenna.

I also purchased one of those cellular-lookalike jobs from RS. This
one sticks to the glass on the rear windshield. It is longer than a cellphone
antenna, though, and has a smaller coil. Sadly, this antenna is inferior to
the magnetic-mount both in range and signal strength. I still have it on my
car because it offers slightly better reception than the rubber duck on my
BC2500, and it works sufficiently for local repeaters, but is thoroughly
unsatisfactory for highway-related scanning.

Both antennas cost about $30, I think. Please consider the
magnetic-mount. It is very effective.

I hope this helps in your decision..

I remember, as a child of 6, while living in England, that there were
trucks that patrolled that could detect where a TV was being used. In
England one had/has to buy a liscense to watch TV (one more way to tax).
Finding people who were not liscensed generated more money as fines.

*** Bob's Tip of the Month ***

(from Monitoring Times, January 1993, Dial 1-800-438-8155, Great Magazine!)

Realistic (R) PRO-39 Cellular Restoration (Page 107)

[with a few comments added by someone who witnessed such restoration -jqt]

The recently released PRO-39 handheld scanner from Realistic (R)
is a fine performer, but its 800 MHz range is interrupted by the
factory censoring of cellular frequency coverage. Long-time MT
supporter Larry Wiland of Youngstown, Ohio, would like to share the
simple fix. Remember, however, that it is unlawful to listen to
cellular phone calls.

(NOTE: These procedures may void your warranty. Do not attempt
them unless you are familiar with small component soldering.
Monitoring Times accepts no responsibility for damages resulting from
attempting this modification.)

TOOLS NEEDED: Fine-tipped soldering iron, desoldering wick,
small Philips screwdriver, long-nosed pliers, rosin-core solder.

(1) [Turn off your radio. Removing the batteries when the radio is ON can
erase the memory! -jqt] Remove the battery door, holder and [battery
pack] from the bottom of the radio.

(2) Remove the four screws from the back of the scanner and carefully lift
the back off.

(3) Unplug the two wiring harnesses at their connectors and remove the six
bright colored screws [that hold] the circuit board in place. Unsolder
the ground wire from the lower right corner of the circuit board.
Unsolder the two wire connections from the BNC antenna connector at the
board. Carefully lift the board (grasping it near the Molex connector)
and set it aside.

(4) Remove the two bright colored screws from the next circuit board.
Carefully unplug the two-wire connector [and remove the board, as I
recall -jqt]. Unsolder and lift the rectangular metal shield exposing
the diodes.

(5) Carefully unsolder and remove diode D6 only; this will restore the
missing cellular frequencies which can be searched in appropriate
30 kHz steps.

This completes the cellular restoration. Reverse all procedures
to reassemble the radio and test it by entering any frequency between

869-894 MHz. [If you are as lucky as I was, the memory will still
contain your other frequencies! -jqt]

Curious about the other diodes? D4 would enable 68-88 MHz
coverage, but deletes 30-54 MHz; D5 (present) allows 800 MHz band
operation; and D7 would make cellular spacing 12.5 kHz (incorrect).

Thanks Larry!

Hello All,
Concerning my post from yesterday...I posted two messages about scanners...
For some reason America Online mailed them 10 times plus, each. I am writing
to let you know that it was the system in fault. I am also wasting your time
again to see if it happens again. If the problem is not fixed I will not post
until AOL fixes the problem or I decide to go to a service that does not have
the problems. From what I understand this newsgroups stuff is new to AOL so it
could just be a little bug. I wonder if anyone has seen this problem in other
groups. If so please e-mail me.
Sorry for the trouble. and thanks for the responses I did get...
Also Sorry I am off-topic.
Brad

> the 800Mhz band.
>
If you can, your scanner must be faulty.
Use another scanner (B), set your scanner (A) to scan. Pick one of the
frequencies in the scan (f) and try listening with scanner (B) at these
frequencies:
f+10.7MHz
f-10.7MHz
f+21.4MHz
f-21.4MHz
Open the squelch of (B), and keep it at one channel. (No scan)

This is assuming that your scanner have a 1st. IF of 10.7 or 21.4 MHz.

Your scanner can be found by the 2nd. IF, most often at
10.7 - 0.455 = 10.245MHz. But they could not say it's a scanner.
It may as well be an FM radio, cordless, ... (insert most radios here)...

Listen for your TV-LO at 47MHz or thereabout.

Try to find your (oldest) portable FM radio's LO. Then let
someone take it to another room and knock on it. Then yell into
it. Amazingly you can hear that in your scanner. So they don't
have to plant a bug in your radio. It's already there. This
probably won't work unless the radio is of the older type with
an air-dielectric tuning capacitor.

I too use the RS Magnetic mount scanner antenna and have had good results
with it. I primarily scan rail frequencies (160-161 Mhz), but have also
used it in the 46 Mhz (cordless phones) and the 450 Mhz range as well. All
have been with improved results over the duckie the scanner came with.

>I'd be interested if other people agree.

I agree, both with the idea that government is too quick to say "there ought to be a law" and that scanner hobbiests are at heart voyeurs. That's where the basic difficulty arises. Laws against Peeping Toms have existed for centuries. Congress is trying to extend that principle into the wireless age, but they're making the same mistake here as they are with the problem of violence in society. Banning scanners will be no more effective than banning guns, and has the undesirable side effect of causing unnecessary harm to legitimate users of these tools. The real problem in both cases is sick and twisted individuals with no sense of morals or ethics, not the hardware that enables them to pursue their voyeurism or violence.

1539. Re: ICOM R1

Newsgroup: rec.radio.scanner
Date: 1994-03-03 15:52:37 UTC
From: rats@cbnewsc.cb.att.com
Message-ID: <CM3Irr.M75@cbnewsc.cb.att.com>
Source record: 276597

In <linleyCM30po.Cuw@netcom.com> linley@netcom.com (Bruce James Robert Linley) states:

|Yes the Icom-R1 is a continuous (500kHz-905MHz?) coverage scanner but
|the R1 describes itself as a "communications receiver", not as a
|scanner. The difference is signifigant. The Icom W2A ham _trans_ceiver
|can receive cellular right out of the box after a 'magic key sequence'.
|It will not be affected by the April Scanner law because it is classified
|as communications equipment, not as a scanner.

Hmm, I seem to recall that "communications equipment" was affected as well by the new law... certainly, I have noticed that ads for the Alinco DJ-580T in the amatuer radio rags don't seem to mention it's 800 Mhz capability anymore... so does the DJ-580T still have 800 Mhz receive capability anymore as of April?

1540. LO detection at a distance

Newsgroup: rec.radio.scanner
Date: 1994-03-03 16:26:08 UTC
From: tw@intel.com
Message-ID: <CM3KBK.BzF@ibeam.intel.com>
Source record: 276598
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Quickly, there are very few different first IF's in use. The local oscillator present in superheterodyne receivers has some small leakage out to the antenna. The local oscillator is a fixed offset from the receive frequency. If you know the make of radio (and hence the first IF) and can tell the current LO freq, you can tell the receive frequency.

Regarding the ability of one to rx the LO at a distance: this was used by the British during WWII. The capability by now is probably somewhat refined.

Now, to the question of where the LO emission is coming from, a directional antenna should be more than adequate given the low power levels involved, but I've not tried this. Obviously the house festooned with antennae is the probable suspect.

Don't legislate stupidity, design it. (oops, I meant *security*)

I've seen one of these units. A friend (private investigator) has one hooked up
to his modified Icom reciever (sorry don't know the exact model number). It
looks like a funny little box that attached between his Icom, then the interface,

then hooked up to his little XT laptop. Pretty nifty device. I know I want one. It displays everything about the call, except for the ESN of the cellular number, but like you said before there is additional software that will display the information, and according to my friend, he says that there is another company out here in the US that sells a similiar device whose software will work on the above unit. This thing tells you the mobile number, cell, etc. It can be set up manually to monitor a particular cellular phone number as well. Illegal to own? Hmmm... I don't know the answer to that, but definately, according the ECPA, is illegal to monitor cellular.

My friend told me that when he purchased his unit, that they charged him another couple of hundred bucks or so in addition just for the software to run the thing. Anyone know if that's the case?

I set mine to 700 to 750F. I'd say that 600F is too low for
typical 60/40 or 63/37 solder used in electronics.

You want to keep it below 800F, as temperatures this high
will cause the copper foil to separate from the board.
Unless of course you want to remove the copper foil. In this
case you do want to set it up to 850F.

True, you want to transfer heat quickly, but I do this
using a *big* soldering iron chip.

I don't think using a freeze spray is useful, as mechanical
motion can disturb the proper liquid to solid transformation of
solder. Moving the solder as it cools can result in a solder
joint that does a poor job of passing electricity.

Here is an interesting article from Feb Issue of Wired Magazine relating to
those who try keep a public eye on stealth aircraft.

Before the text of the article there are two short notes relating to this
article. First, NBC Unsolved Mysteries, on tonight's show, will air the 9
seconds of video taken by Steve Douglass of what is believed to be the TR3A
Black Manta. Second, if you want your own minature collection of the SR-71,
Aurora and TR3A, check out your local TOYS-R-US for the Micro Machines
Military set with these planes.

From WIRED Issue 2.02

Stealth Watchers

Armed with Radio Shack scanners and PCs, Steve Douglass and a small group of private citizens are unmasking the US Defense Department's black-budget aircraft. Phil Patton reports from Dreamland.

First Steve Douglass heard and saw familiar shapes - F-117s he had seen many times since they emerged from the black-budget world; Stealth fighters he had tracked and monitored when they were still secret. Then came one that was slower, with a different sound, a different shape. Douglass's radio scanner crackled, the numbers churned on its readout. He was at White Sands Missile Range, and the sky was filled with B-1Bs and F-15s. He raised his video camera - and the battery warning light flashed. He grabbed seven seconds of video before the machine snapped off.

Douglass had gone that May weekend with his father-in-law, Elwood Johnston, packing his Radio Shack Pro-2006 and other scanners, to cover an exercise near Holleman Air Force Base in New Mexico. He received a tip that something interesting would happen. Now, in the living room of his ranch-style home in Amarillo, Texas, the country's top military monitor shows his tape. Beavis and Butt-head disappear from the screen, and from a powdery mix of colors emerges a dot, a dot growing larger, a dot becoming a winged bat, a ray-shaped airplane swooping overhead - then the image dissolves to gray grit. He flicks the machine off. "Seven seconds," he says. "You live for those moments. You listen all those hours for that kind of gold nugget."

The "bat" is a still-secret TR3A Black Manta, captured on video for the first time by Douglass - the dean of a new culture of digital scanner buffs who monitor military channels to find secret planes. The image is published here (see page 83) for the first time (the 5,000 or so subscribers to Douglass's Intercepts newsletter got a sneak preview last fall).

The Black Manta operates in tandem with the F-117A Stealth fighter, and although evidence suggests it was used in the Gulf War, the Air Force has yet to admit its existence. With the help of a frame grabber, Douglass printed an enhanced view of the bat plane after he returned from White Sands. Then, consulting with his wide network of experts in the industry, the aviation press, and the military, Douglass tweaked the details to create a speculative image of the airplane the government says does not exist.

Thanks to new technology, military monitors and stealth stalkers can listen in on the President talking from Air Force One and hear pilots from mysterious planes called Manta and Aurora. Around 1970, solid state electronics replaced old crystals as the heart of scanners. Before long, you could buy a 200-channel scanner from Radio Shack for about US$300. Radio Shack has sold more than 4 million 2006 scanners worldwide, but Douglass estimates there are probably only about 500 hardcore military monitors in this country - which is by far the most relaxed nation when it comes to civilian ownership of such equipment.

Several other companies, including Bearcat and Uniden, also make scanners. Current equipment can cover thousands of channels a second, defeating most

"channel-hopping" transmitters. Encryption is used at high-level bases, but it's expensive and vulnerable to atmospheric shifts. Until recently, even Air Force One broadcast communications without first encrypting them.

It's all completely legal - except for the practice of listening in on cellular phones, something Douglass finds of little use. When he was suspected of tapping the cellular phone of a Texas congressman - the FBI paid Douglass a visit. Suits suddenly appeared in the windows of the long-vacant house behind him, and a bug showed up on his phone. The real culprit was later found, but Douglass now sweeps the place monthly for bugs.

Long before they tried to find out about the Manta or the Mach 6 Aurora, monitors, and black birders told us about the U-2 and a project called Oxcart, which turned out to be the SR-71 Blackbird. They insisted that the Stealth fighter existed years before the Air Force released the first murky snapshot and admitted its existence. (Some stealth watchers even believe the Air Force called the fighter the F-117 simply so they could go on insisting there was no F-19, the logical designation for a new plane in official sequence. "Adds up to 19, right?" smirk the stealth watchers.)

To those who criticize their listening in and who accuse them of endangering national security, Douglass and other monitors answer: "Hey, Radio Shack sells to the bad guys too; anything we can hear, the spies can hear too." In Douglass's thickly carpeted retreat, six scanners work steadily, hopping from channel to channel - short wave, VHF, UHF, sideband - all feeding into a little voice-activated Radio Shack tape recorder that vacuums up every scrap of voice, packing a day's talk into 90 minutes or so that Douglass listens to late at night.

After years of practice, his ear strips away the static; he listens simultaneously to stereo, television, and multiple scanners. Models of planes hang from the ceiling, pictures of planes line the walls. In one corner lurks a huge oscilloscope - military surplus - and a Hallicrafter's short-wave set, packed with tubes, picked up for $25 at a garage sale.

There are maps of military bases and of New Mexico, as well as a Landsat photo of the F-117 base at Tonopah. Red and blue lines on a map show main air routes, and refueling courses. Amarillo is dead center in the heart of the country's military flyways. "Why go to Groom Lake," people ask him, "when the planes seem to come to you?" Douglass has been uncanny in catching, say, F-117s coming almost over his house. "It's as if they know where you live," his colleagues joke. Flying high and fast, taking off and landing from secret bases of sand and sage as big as Switzerland, the black aircraft elude the senses: By the time you hear them, they have passed.

But as Douglass knows, a scan of radio frequencies will tell you where to look. In one of the coups from which his reputation was made, Douglass took the first pictures of the "donut on a rope" contrail associated with a mystery aircraft, possibly the long-rumored Aurora reconnaissance plane that the Air Force denies exists.

Now he shows off his latest find, the Black Manta. He loads sound bites captured at White Sands onto Soundscan files on his Performa 450. This allows him to set them off one by one, clicking each little folder, so they explode like little firecrackers, with sharp sparks of voice amid the smoke of static. "You've seen one of these before, haven't you, Steve?" says the voice of one airman talking to another (the coincidence of the name seems like a taunt). And the pilot complains, "I've got a couple of screws loose on the heat shield." The tail number is given - 806 - but F-117s stop in the 600s. All this tells Douglass the airplane is an unusual one - almost certainly a TR3A or another secret plane.

The maintenance and security people talk about the arrival of a VIP in the morning. Later, Douglass would discover that General Colin Powell, then chair of the Joint Chiefs of Staff, had been visiting El Paso, Texas, the day before. He suspects Powell might have made an unpublicized side-trip for a glimpse of the Black Manta. Douglass and his wife Teresa, an artist and computer whiz, write and publish Intercepts - a newsletter for monitors - from their home. Douglass also runs a BBS and operates the Above Top Secret forum (under Aviation, Military) on America Online.

He is a stringer for CBS, and monitors fire and police channels for the Amarillo Globe Times, where he spent six years as a news photographer. He's just finished The Comprehensive Guide to Military Monitoring, which is likely to become the bible of military monitoring, sharing tricks, frequencies, and some of the wonderful American music of callsigns and radio vocabulary. In the pages of Intercepts he runs letters and columns above the code names of correspondents: Darkstar November, Big Red, Lone Star, Ghostrider - some of them people with jobs they don't want to jeopardize by using their real names.

Douglass has subscribers at CIA headquarters in Langley, Virginia and throughout the military. His followers are hackers of a black-budget world, an underworld that costs American taxpayers about $16 billion. Looking at the federal budget, it's hard to figure out how all that money is spent.

But one can see where it ends up: The parking lots at Lockheed remain full and analysts show the sum of its work from federal projects swelling from $53 million a few years ago to some $400 million last year. Bubbling away on an old Commodore 128, soon to migrate to a Mac, Douglass uploads selected items from the Intercepts bulletin board to America Online.

On AOL, he finds, many stealth chasers are meeting each other for the first time. The service, Douglass says, has become a clearinghouse for monitors to share military intelligence. "It's almost like a public intelligence network," he says. Douglass's frame-grabbed print of the TR3A looks at first glance like a flying saucer. No wonder monitors are often equated with the UFO gang.

"That word is misused," he says. "Yes, (secret military planes) are objects, they fly, and they are unidentified." Some of his subscribers are saucer buffs; others threaten to cancel their subscriptions if "any of that UFO foolishness" shows up in his pages. But, like it or not, some of the best-informed stealth watchers believe that the military is "reverse engineering" alien craft at a site called S-4, near Papoose Lake inside the military reservation south of Groom Lake in Nevada.

The ideas of both secret planes and flying saucers strike deep chords in the collective unconscious. They may be the demons and the angels of our time. The two groups merge almost seamlessly into each other. Descriptions of sightings sound similar: "there was a very, very low rumble, like air rushing through a big tube" or "the lights had a diamond shaped pattern and the object turned rapidly and dashed away."

"They really are unidentified flying objects," says Tim Weiner a Philadelphia Inquirer reporter who dissected the black budget and described secret aircraft in his definitive book Blank Check. "Sent by a mysterious alien civilization - the Pentagon." The best places to monitor are in the west: Tonopah, Nevada, where the Stealth fighter was based; Holloman AFB, New Mexico; Edwards Air Force Base in California; plant 42 in Palmdale, California run by Lockheed; the mysteriously shaped radar cross section test facilities at Tejon Ranch, California, and Groom Lake, the holy of stealth holies.

In addition to the TR3A, which hunts in concert with the F-117 and seems to be a reconnaissance and laser designator craft, the plane that draws the most speculation is called Aurora. Its real name, if the craft does indeed exist, is not known. But many reconnaissance programs have been given names related to the dawn. In 1986, a censor's slip left a line billed "Aurora" unblackened in the public version of the Pentagon budget. That is the name most often given the new spy plane, although another Pentagon designation is "Senior Citizen."

Some say Aurora flies without a pilot - like the remote-controlled drones that plied the skies during the Gulf War, but pumped to supersonic performance. Some say there's a bomber too, perhaps a whole family of strange birds. There's one stalkers call "The Mother Ship," that looks like a Concorde with stubby front fins, or canards, similar to the XB-70 of the '60s. Others are nicknamed Honey Dripper and Goldie.

No one knows for sure how many real planes these sightings represent. "It is useful to consider mystery aircraft not simply as an engineering product, but also as a sociological and epistemological phenomenon," reads an oddly unscientific sentence in "Mystery Aircraft," a 1992 report by The Federation of American Scientists. That report concluded that it was highly likely that these craft exist, but unprovable. There is, the American Federation of Scientists says, "a signal to noise ratio" problem in dealing with secret aircraft. Or as Douglass puts it in Texas Panhandle vernacular, "it's tough to pick the pepper out of the shit."

There are all kinds of monitors. Monitoring Times, for which Douglass writes a column called "Federal File," speaks to an audience of some 40,000 people, of widely differing interests. Some listen to locomotive engineers, others to ships at sea. Although military monitoring has been called "ham radio cubed" or "super ham" and the scoops monitors provide are often described in the press as "ham radio reports,"

Douglass says the monitoring culture is misunderstood. "Hams say, 'you can only listen?' They look down on monitors," Douglass explains. Monitoring culture is more closely related to the nation's brief infatuation in the mid '70s with CB Radio. Motorists listened to CB to find out what the police were

doing; many then graduated to police scanners that let them listen to the police directly. Douglass played around with CB until "the idiots all got on."

Douglass grew up in Idaho, where he came to love airplanes after going to local air shows. His work at the Amarillo Globe Times, where he used police scanners to track stories, made him curious. He began to wonder what else was in the air. "It was like the old George Carlin bit," he says, "'what's on beyond the edge of the dial, after the knob stops? What are they hiding out there?" Douglass began feeding information to The Associated Press, then to NBC-TV.

His first coup came in 1986, when he picked up transmissions from a Soviet nuclear sub with a critical nuclear reactor problem. In an early sign of detente, US Navy ships rushed to the scene to help out. The Pentagon denied the story, but when an AP reporter brought in Douglass's tape - on which a sailor screams: "It's sinking! It's going down! Radiation counters are going up!" - the military finally admitted what was going on. Television cameras were present when American ships rescued the Soviet crew.

Douglass heard the troops assembling to invade Grenada, then Panama. During the Gulf War, he fed shortwave reports of Scud launchings from troops in Saudi Arabia to network reporters before their Israeli bureaus heard the sirens.

In 1989 Douglass picked up communications between "Joshua control" and an aircraft calling itself "Gaspipe." He realized it was flying close by. He ran out of his house, slapping film into his Canon AE-1. He could hear the rumbling sound of the engine, even feel it in his chest, but all he saw of the craft itself was "a silver glint of light, a metallic shape." Even with a 400-mm telephoto lens he managed to photograph only the plane's contrail with the Aurora's purportedly characteristic "donut on a rope" shape, suggesting an advanced pulse-jet engine. Aviation Week ran the photographs.

Later, he talked by phone with a pulse-jet engine expert he knows at a military contractor. The engineer played chords on a synthesizer over the phone, striking lower and lower frequencies until Douglass found the one he had heard. "Damn," the engineer said, recognizing that his rivals had perfected the advanced jet engine, "they've done it."

Black planes raise dark issues. Critics say now that the Cold War is over and now that satellites (run by the folks over at the National Reconnaissance Office, whose very name cannot legally be spoken by government officials) can see through clouds there is no real need for these planes. Some question the stealthiness of any "top secret" plane that amateurs can pick up on a Realistic Pro-2006 scanner from Radio Shack.

For many, the issue is cost: A covert program costs two to three times as much as an overt one. Others wonder about duplication of research efforts on the black and "white" sides of aviation. The technology of Aurora and other airplanes is close to that for the National Aerospace Plane, or X-30 - Ronald Reagan's Orient Express - a dreamed supersonic airliner. Is the same work being done twice? Or is the $600 million budget line for the NASP, as one European Space Agency scientist has claimed, simply a cover for Aurora? And

many suspect that the stealthiness of these airplanes has less to do with escaping detection by enemy radar than with escaping detection by the public, the press, and Congress.

Some experts estimate that black-budget aviation programs are the largest single item in the whole Defense Department budget and that keeping them out of the public eye protects them from congresssional budget cutters.

Those who doubt the usefulness of what the monitors do should consider a phone call Douglass got not long ago from the father of a dead B-1B pilot. The airplane had crashed into a mountainside, and the Air Force blamed the pilot. Investigators came to the father's house, asking him if his son was a homosexual or a drug abuser. Congress was considering further funding for the B-1B and Douglass, after hearing of the crash, checked his scanner tape from the night before. It clearly recorded the pilot complaining of problems with the plane's autopilot. When the news came out, the military brass denied that any "amateur ham radio operator" could have such information. But Douglass had the tape and was able to tell the father the truth. He can't answer all the big questions, but he could answer that one.

******* SIDEBAR *******

A Visit to Dreamland They call it "Dreamland," the Shangri-la, the Forbidden Temple of black aircraft. The Groom Lake secret base in central Nevada, a.k.a. Area 51, is set amid a bomb range as big as Switzerland and is off limits to visitors. Here the U-2 first flew, and the SR-71 Blackbird and the F-117 Stealth fighter - all in secret.

Only a few grainy pictures of the place exist; it is illegal to photograph - or even to sketch. Fighter jocks in the area call it "The Box" and if they stray into it they are interrogated, harangued, and grounded. Groom Lake is tough for military monitors. Most radio transmissions are encrypted - a costly and difficult process rarely undertaken by the military.

But there are a couple of places from which to actually see the Groom base. This spring, secret plane and UFO buff Glenn Campbell, a military monitor and author of the Area 51 Viewer's Guide, discovered the closest and most accessible viewpoint. He named it "Freedom Ridge" and was delighted when he heard the local guards using that name on their radios.

The first Lockheed engineers who brought the U-2 here in 1954 wryly named the place Paradise Ranch. But sometimes in the early '60s the name "Dreamland" began to appear on military maps. Today, it is omitted completely, and Landsat offers no satellite photographs of the area, although the Russians will sell you one for about $5,000.

In 1984 the military went to the Bureau of Land Management and had large tracts of land around the base declared part of the Nellis Bomb and Gunnery Range. The perimeter is marked by signs along roads warning "use of deadly force authorized." But two high points that allow a glimpse of the base to intrepid hikers remain accessible.

Last October, the military filed papers to take over those points too. In protest, two dozen stealth chasers, monitors, and UFO buffs climbed to the top of Freedom Ridge for a final glimpse before the shades came down. I joined them, driving up from Las Vegas past the B-1s landing and taking off at Nellis Air Force Base.

The desert seemed like low-res detail on a flight simulator game: RISC landscape. I came to the little town of Alamo, then through a pass in the hills, when suddenly a white stick of gravel road appeared, heading off to Groom. Cars send up dust streamers on this road, as they rise steadily up it, mile after visible mile. Hiking up to Freedom Ridge, we dodged the brambly and fragrant sage and the fuzzy, Muppetlike Joshua trees, we crossed rocks that seem inscribed in some alien cuneiform.

We walked a few feet from the perimeter of the base, marked by orange sign posts running across the high desert. On the other side of this barrier were strange looking silver balls the size of basketballs on poles, said to be motion detectors or other sensors. Some claim these can sniff the difference between a human and a wandering wild burro or rocky mountain sheep - the place is a de facto wildlife preserve.

At sunrise, helicopters sweep along the border and semi-private Wackenhut guards, known locally as "Wackendudes," keep an eye on intruders and call the local sheriff if need be. This day, a few Wackendudes appeared, then retreated.

The base unfolded beneath us as we reached the crest - the long white dry lake, a line of buildings, fuel tanks, an old bus, satellite dishes, a big hanger said to be for the Mother Ship, and a seven-mile runway. The only black birds we saw that day were ravens - eight or a dozen hovering near sunset in the thermals at the edge of the rocks, spiralling in formation. As night fell, the lights came on in the base below, where personnel were probably watching the World Series more intently than they watched the few people, high above Dreamland, watching them.

Douglass used seven seconds of blurry video, a frame grabber, and graphic enhancement software to produce this estimate of what the still-secret TR3A Black Manta might look like.

There is an electronics company in Germany selling Yupiteru MVT7100 scanners with a switchable filter modification. I am not sure of the spelling of the name but I think it is "Berghartz".

Could someone provide the correct spelling, address, telephone number, fax number or (wonder of wonders) internet address?

Message-ID: <1994Mar4.010638.9911@btree.brooktree.com>
Source record: 276608

I am having a problem with the PostScript Frequency Book.
After uudecoding the text file I get ps.pbs.Z.
Is this some form of compression, Self extracting archive or what?
What do I do with it now?
Any help for "a Computer Support person who just dont know"
Thanks
mhardy@brooktree.com

Does anyone have any opinions on the wide-band receiver portion of
the Icom IC-2SRA? How does it compare to the Icom R-1, which
supposedly has severe problems? How does it compare to other
receivers?

Well, the frequency range is not really correct. However, if you were to use a 300 ohm to 75 ohm transformer at the antenna (mainly to cut down on signal pickup by the feedline), it should work fairly well.

: more than 4 million 2006 scanners worldwide, but Douglass estimates there are
: probably only about 500 hardcore military monitors in this country - which is
: by far the most relaxed nation when it comes to civilian ownership of such
: equipment.

I doubt if the US is the most relaxed nation. For example, I believe that
Canada allows the same scanner privileges - and does not require cellular
frequencies to be blocked.

: Several other companies, including Bearcat and Uniden, also make scanners.
: Current equipment can cover thousands of channels a second, defeating most
: "channel-hopping" transmitters. Encryption is used at high-level bases, but
: it's expensive and vulnerable to atmospheric shifts. Until recently, even Air
: Force One broadcast communications without first encrypting them.

This is also bogus. There are no commercial scanners that can cover
"thousands of channels a second" - although 100 c/sec is becoming possible.

I don't know what "atmospheric shifts", but scrambled signals should not be
any more vulnerable than signals in the clear. And, cost has never been a big
concern for the US Military.

... rest deleted ...

Overall, an interesting article. I wish they would try to be a bit more
factual, however.

Hm. Considering this again. The TV antenna, if it includes both VHF and
UHF, would cover most of the frequencies of interest.

I agree. I really have no interest in listening to cordless or cellular
conversations. As an amateur radio operator and EE, I either own or, if
the challenge arose, could build the equipment needed to monitor.

Once the government starts making the interception of certain signals
illegal, therein lies the challenge! Once you have somthing "cracked"
the fun is gone, IMHO. Same for digital encryption. The fun is in
cracking the code. Or at least getting to that point. Once the code
is cracked, it's time to move on. The only way to know if any
encryption method is secure is to ENCOURAGE people to crack it. As
with monitoring cellular and cordless phones, passing laws does
nothing. Same with digital encryption. If you have to pass a law
against breaking a code, how good is the code in the first place??

If you find such things intersting, check out sci.crypt, also on
the internet.

I use RG8-SAT coax for my vertically polarized VHF/UHF TV log peroidic antenna and it works great with my 2006. 45Mhz reception is pretty decent, as the antenna includes elements for TV channel 2, at about 54Mhz. RG8-SAT, is 75 ohm coax if I remember correctly.

This antenna only cost me the price of the coax, as I used my parents old antenna! They've had cable for 10 years now. Its a great solution, as many people will give you the antenna for free, and sometimes even the tower. The Scanner Beam that Grove sells is nothing but a VHF-UHF TV antenna, so if you wanna save some money...

[e-mail to reply. My address is in the following signature file.]

Motorola charges $55.00 (each) for new reeds. I am in need of 2 and am in search of a lower cost. The 2 I need are "457.1" and "691.8". Pointers or offers are very welcome.

For those who wonder, I have switched fire depts and would like to continue to use my personal pager (yes they share the same frequencies). My hope is that others have gone this route and may just have one (or both) their willing to sell for a good price. Spending more than 1/3 of the units cost for a reed change is out of the question.

Yep: The antenna does rebroadcast the mixer freqs. I built a 6-el. Yagi,
and when I tune my radio to 10.85 (first IF stage frequency) MHz above the
target frequency, I could use the Yagi to point the rebroadcast towards
another radio tuned to that target frequency, and it was quite strong
enough to break squelch on the other radio even at distances of ~100-200
feet. Even with the rubber duckie antenna on, the radio still broadcasts
the IF, though obviously not quite as strongly.

BTW, I have a (heavily modified) BC100XLT, though I haven't messed at all
with the mixer stages or anything like that.

>
Detecting TV use is a lot easier than detecting scanner use (TV detection,
I believe uses the high voltage horizantal signal applied to the TV tube -
which gets radiated much more strongly than the scanner oscillators' signal.
Bottom line - if someone really wants to spend the money and is 'close
enough' to a scanner, they can find its presence. But most - if not all
such techniques involve transmission of some kind and looking for a
response. So if someone is doing a security sweep, sure they can find it
if it meets these criteria - though they can't tell if it is a scanner or
SW Receiver. Any corrections/additions/deletions are welcome.

An anecdote comes to mind: A few years ago, there was a big furor about
the Soviets (yeah, in the old days) putting bugging devices in the US
Embassy being built. It should be stand operating procedure to check for
bugs in an embassy (my guess), but when the US de-buggers checked by sending
a pulse and looking for echos, they were getting the echos from everywhere
because there were thousands of tiny diodes mixed with the cement. Someone
correct me if I remember it incorrectly (and change the SUBJECT accordingly).

Last semester, while in Mexico, I used a spectrum analyzer (one of the few
good pieces of equipment there in the lab) to look at the antenna output
of my BC100XLT. I was mildly surprised: the level of the 1st IF (10.85
MHz for the Bearcats) was around -40 to -50dB (dBm, I think), which
surprised me becuase a lot of the signals which the scanner is able to
monitor without too much static are only received around -100dB. So my
scanner sends out a good bit of strength on the antenna "input".

Been there, done that. My Congressman ignored my letter. The law didn't pass on his watch, so, in the finest tradition of politicians, I guess he feels no obligation to deal with it.

Amen to the long, long time. I just tuned up my old BC220 table-top scanner. 15 years old, 20 channels, and no 800MHz, but still not a bad radio if your city hasn't gone to trunked public service.

>I'd be interested if other people agree.

Yup. These laws, if I'm not misinformed, are unique in recent history in that up until their enactment, it was legal to listen to any waves passing through your home, as long as you didn't act on or disclose what you heard. You are now a criminal if you choose to *tune in* to these particular band segments, regardless of what you do with what you hear. More such laws will follow, since government and regulations never shrink in size.

>--
>Michael E. Nagel
>Office of Development

This may have more to do with where you are and what you are trying to pick up. If you are close enough to all the important things you want to receive in the Condor's three tuned bands, then the antenna will seem to perform no better then the whip. In my rural situation, some of the public saftey freqs. I routinely listen to are just far enough away to be a hard pull for stock antennas (although to be sure some of them are better then others), but the Condor brings them in just fine. It is a somewhat "narrow mission" antenna if you will. If your situation warrents it, it will help. Otherwise it won't make a difference. If you listen a lot to stations outside of its tuned bands, it will even make them worse...

1572. FBI's Uniform Crime Reporting Codes?

Newsgroup: rec.radio.scanner
Date: 1994-03-04 21:55:23 UTC
From: georgef@microsoft.com
Message-ID: <CM5u8C.7qr@microsoft.com>
Source record: 276530

Does anyone have a complete list of the "Uniform Crime Reporting" codes supposedly developed by the FBI? A local PD uses these for their clearing codes.

The list includes:

0300 Robbery
0400 Assault
0500 Burglary
0600 Theft
1400 Malicious Mischief
1800 Narcotics

The type/location/severity of the crime can be reported in more detail by using numbers between the 100 series (like 401, 402, etc).

>supposedly has severe problems? How does it compare to other
>receivers?
>--
>David Moews moews@math.berkeley.edu

Its a great HT and scanner. I have had almost no interference problems with
this radio. It has good sensitivity but intermod is very rare on this unit.
The 2SRA goes down to 25MHz while the R-1 goes down to 100KHz (?) so these
two radios are not really the same. If your interest is VHF and up and you
are a Ham (or will be) this is a great radio. Keep in mind that the wideband
side antenna has a 1/8 inch plug and hooking an external antenna is a bit
difficult.

>--
>Michael E. Nagel
>Office of Development

I did the same swap as you did 200 -> 2500 and have been pleased with the added performance (i.e. scan rate & features). I have noticed some increase in intermod, but I have since moved to a more rural area and now have very little trouble. My suggestion to you is MOVE! ALL scanners on the market have very poor RF performance compared to Ham or commercial equipment. For most people that's not a problem, but for people who live close to transmitters it just doesn't cut it. Short of moving, you could 1. Get commercial grade receivers (usually one for each band you want), 2. Get a radio that supports CTCSS (this will only work for scanning PL encoded signals), 3. Build some notch filters with a BNC T connector and some coax (make a tuning stub), get a very directional antenna with high front to back ratio (such as a corner reflector type). Thats all I can think of at the moment.

1576. What to buy before April?

Newsgroup: rec.radio.scanner
Date: 1994-03-04 23:02:34 UTC
From: bmiller@landesk.intel.com
Message-ID: <2l8ema$nm8@ornews.intel.com>
Source record: 276534

I am normally very decisive on what I want, but this is a little different.
I would like to buy one more scanner before the April cutoff. I don't really
need another scanner, but for possible future investment, I'd like an extra.

I want one with 30Khz steps at 800MHz. I have considered the MVT-7100, but
I can't justify the cost. I am leaning toward the pro-43 since I already
have the BC2500. Does Marymac still sell modifiable pro-43's? or does anyone?

Any other suggestions on what would be a good investment under $500 It could
be base, mobile, or HH.

For some reason I just can't imagine an Icom R-9000 being sold as:
" DC to DAYLIGHT (less cellular)"
What is this world (country) coming to?

Post or email Thanks

I don't have acttual codes for Ottawa, but I know where you can get them. Go to Radio Shack and buy the Haruteq (sp?) Scanner Guide. It retails for about $20. This list all to codes you want, for all of Ontario (including Ottawa).
Do you ever listen to stuff from Hull? Is it much different from Ottawa, other than possibly being in French?

Todd

> what critical. Too close to the lcd display and it will pickup electrical
And, I want to thank you for letting me see that. As a blind user, I can
highly intuit that this is an excelent means of us psyching out the
scanner.
My biggest problem is determining if a channel is in delay, or non-delay
in my realistic 2004.
I can't hear any popping from the unit, so I have used my yupiteru to
listen around 500mhz for interference.
But, the trick with a telephone pickup coil offers a lot of
possibilities for "hearing" what's going on.
Maybe even possible to listen to the display buz to get a sense of other
changes taking place.
Because of the inaccessability of these devices, we have to look at all
kinds of cludges to make things work, and adapt to our needs.

In the Western provinces, we are fortunate enough to have a publisher called J & M Communications Ltd. They annually release the British Columbia Frequency List ($18.95), Pocket Size Frequency List for the Lower Mainland ($9.95), Alberta Frequency List ($18.95), Saskatchewan Frequency List ($14.95), and How to Get the Most From Your Scanner ($12.95). The Alberta book has 93 pages, gives general information about scanner use, police codes, home-made antenna suggestions, a trunked radio frequency table, channels sorted by service per city, and channels sorted by frequency for the whole province.

J & M books are available at technical bookstores and every Radio Shack in B.C., Alberta, and Saskatchewan. The Radio Shacks in the other provinces carry books by other publishers. In Ontario, you can ask for the "Haruteq Scanner Book." It's listed for $21.95 in the Fall 1993 Radio Shack catalog.

-=> Quoting Mahjmac

Ma> It is my understanding that when you place a call to a forwarded cell
Ma> phone, the call does goe through the cellular system, and is then
Ma> forwarded through the cell system to the ultimate destination.

Yes, but its not going out over the "air" to the persons cellular telephone.

Ma> Cellular companies don't have a physical line for every car phone that
Ma> exists. They have a bank of lines to support the estimated peak
Ma> traffic conditions. If you are tying up one of their physical links,

This is true not only with cellular telephone companies, but with most
business telephone setups as well. It is interesting to note that you are
not charged everytime you take up one of their physical lines. For example,
I am not aware of any cellular co. that charges you for a received call
that you don't answer. Nonetheless, this takes up one of their physical
lines, and could do so until the caller disconnects.

Ma> then it is quite possible that another cell user may receive a reorder
Ma> or redial message if all the outbout (make that outbound) lines are in
Ma> use. By tying up one of the outgoing lines, you are preventing other
Ma> callers from using them, ultimately reducing their revenue potential.

Again, true.

Ma> My advice would be to always MAKE SURE you know all the details about
Ma> something first. If it sounds too good to be true...

He did. He called his cellular provider and asked them how much it costs.
What more could he do?

Ma> I would have asked more specific questions about what you were trying
Ma> to find out from the cell rep.

What could me more specific than "How much does call-forwarding cost?"

Ma> Sorry to hear about you large bill. While it all may seem like
Ma> highway robbery, you have to remember that they can charge whatever
Ma> people are willing to pay for their services. As a business owner, I

Sure, so long as they tell you what it is when you ask.

Ma> pay hundreds of dollars each month in cellular service expenses. For
Ma> me it is justified as the business I accomplish with the phone is worth
Ma> more than the service.

And I am sure that you were told how much it would cost.

The point here is that the cellular company "lied" to him, by telling him Call Forwarding was "Free." Having told him that it is free, he should not have been charged "air time" for what is agreed to be a call that does no go out onto the air.

Li> scanner. The difference is signifigant. The Icom W2A ham _trans_ceiver
Li> can receive cellular right out of the box after a 'magic key
Li> sequence'. It will not be affected by the April Scanner law because it
Li> is classified as communications equipment, not as a scanner. However,

I would call Icom before you say that. Icom says that any W2A's into the
US after the "magic date" will not have the "magic key sequence" enabled.
This is also true with Yaesu FT-530 and Kenwood products (they will
not be cellular capable). At present, all three plan to ship massive
quantities into the U.S. before the cut-off date, and continue selling
the ones that will receive cellular until they run out. Apparently,
the law applies to importation and manufacture, not date of sale.

All

Phil,

I also primarily scan the rail frequencies and am considering the
purchase of the RS magnetic mount myself for my PRO-43.

I'd appreciate any comments you can make on how you like yours ? How much
did it increase your range over the basic duckie you had originally ? Is
it tuned in anyway to the 160-161 bands ?

Anyone else who has a preferred antenna choice for the 160-161 and a
PRO-43 I'd appreciate your input also !

Thanks,

Peter

Does anyone have any information regarding NASCAR frequencies?
My brother is planning on going to the Michigan 500 (this May?)
and wants to use my scanner. Do they sell a freq. list at the
race? Price? Do the frequencies change from race to race? How
many of the frequencies are above 512 Mhz (that's the highest
my RS Pro-42 will receive)? Is it worth taking a scanner to
(I mean can you actually hear anything interesting)?

Thanks

: receivers?

The ICOM scans extremely slowly. I don't have an R-1 to compare it
to, but would expect that the intermod would be about the same, in
both.

Write another letter to your Congressman. Mark it "personal and confidential"
on the envelope. Inside, tell him that some member of his staff is discarding
constituent letters without reply. That's the only real firing offense for a
Congressional staffer. Constituent services are the life blood of any Congress
critter with hopes of re-election. He will pay attention, and you'll at least
get a form letter thanking you for your input in the future.

Never *ever* let a politician get away with not answering his mail.

Thereis no such price; this radio is not officially distributed in the
United States. You can import it from UK or Canada; plan to spend about
$600.

s> From: sdavies@vx9000.weber.edu (Sven Davies)

s> Can anyone suggest a good inexpensive (possibly moble) scanner for
s> someone who is just starting out.

s> Thanks in Advance

Hi, Sven...Depends on what you want to listen to. What is your interest.
If it is police and fire, you may want to find out if the services you want
to monitor are in the 800 Mhz range. Some scanners don't have the 800, so
the cost is lower. (Get Police Call from your Radio Shack store to see
what freqs your depts use.)
Some of Radio Shacks scanners are the best ones to purchase. They are a
bit pricey on the units with 800 Mhz. Range from 229 to 400 bucks.
Have heard some positive comments about the 200 Xlt made by Uniden
Bearcat...usually about $200.
We have been talking 'bout handhelds here...so I will discuss some of the
base units.
The 2030, made by RS is an excellent starter unit at $200. It covers the
800 Mhz band and is fun and easy to use. The 2006, which is $400, is the
utltimate receiver for the price. It is one that will last along time and
has a good following with most of the users of this net. (The 2006 can be
had at a discount from Grove or Marymac.)
Check around on here and see if you see some used products on sale. You
can usually get a good deal here.

> Doesn't the text of the law read it's illegal to import/manufacture
> scanners with cell capabilities when they're FORSALE?
> I think forsale is the key word, unless my brain is imagining words..

From Larry Miller's column "Communications" in Monitoring Times, Jan 1994:

FCC TO PROHIBIT INDIVIDUAL SCANNER IMPORTS!

With the passage of the Telephone Disclosure and Dispute Resolution Act
last year, the Federal Communications Commission banned all pending and
future certification of scanners that could receive cellular telephone
calls, either right out of the box or after modifications. An individual,
however, by filing FCC form 740, could import up to three uncertified
radios for his own use.
Now, according to an official response to a former MT advertiser,
Javiation of England, {italics begin} it will be unlawful after
April 26, 1993, for Americans to import such devices even with the
proper filing of form 740. {italics end} On that same date it will
no longer be lawful to import or manufacture for resale such scanners
in the United States.

[excerpt ends]

So, no matter how you read the legislation, it would appear that the
FCC has already interpreted for us. Load up on those cell-scanners while
you can!

Cheerio!

The wideband receiver is as bad as the R-1. No selectivty at all! In the
UHF range they are both very sensitive. I really hate the plug in
connector they use on the 2SRA/E. I lost 4 antennas in the two years
I own it.

Too bad there is no relaisfunction on it.

Hi, Sven.
I use the BC55 xlt. It's cheap, has no features, and doesn't receive significant portions of the spectrum. BUT: it's all that I can afford right now, and I love it. I've seen it sell for as little as $66 from Damark new, and as little as $10 used, (Mine) I make my own antennae, which is easy and fun, and, until I get some extra bucks to sling around, I am happy with it. A cheap puppy like this is a good way to see if you are interested in scanning, but If you are going to buy one new, I'd save my pennies and get one with more than tenn channel.

1605. Icom Package For Sale

Newsgroup: rec.radio.scanner
Date: 1994-03-05 20:49:26 UTC
From: dsring@equinox.unr.edu
Message-ID: <1994Mar5.204926.19940@news.unr.edu>
Source record: 276562

I have the following Icom equipment for sale which I wish to seel
only as a package!!!! The radio has a clean bill of health from Icom
service, dated 12/28/93. The radio and all of it's accessories are in
excellent condition and have been well cared for.

IC W2A (2m/440 Handheld Transciever)
HM 65 (Speaker Mic. W/earphone jack)
BC 72 (Rapid Charger)
2-BP 84 (Battery Pack, Provides 2 watts)
2-BP 85 (Battery Pack, Provides 5 watts)
AD 20 (Charging Adapter, Used with BP 84)
LC 73 (Radio Case)
BC 77 (Standard Charger {Comes With Radio})

$$$$$$$$$$$ This would normally run around $1000.00 NEW $$$$$$$$$

I am asking $600.00 for everything or best offer.

For the avid listner this radio doubles as a scanner!!!
It will cover all the am aircraft and public service in vhf/uhf
as well as cellular...possibly on up to the 1300mhz area.

Please contact me at:

1606. Putting rotator on chimney (a problem)

Newsgroup: rec.radio.scanner
Date: 1994-03-05 20:51:23 UTC
From: WILSON@SLUVCA.SLU.EDU
Message-ID: <01H9M7IC5O4Y9BVV4S@SLUVCA.SLU.EDU>
Source record: 276563

I just bought a rotator and beam from Grove. Well today I
attempted putting it up. Here's my problem: the kit I bought from
RS isn't sturdy enough. I bought the chimney mount that has the two
steel straps (18ft long). However, when I strapped it on the chimney
it was nowhere near as tight as it should have been. If I would have
put the antenna (with the rotator) on the mount, it would have fell over
in a 20 knot wind!
I only other way I could do it is to drill holes in the chimney. I
DO NOT want to do this. The chimney isn't in the best shape in the first
place. But I do believe the mount would have been just fine w/ the
rotator and antenna. I just can't get it tight enough!
Can someone please tell me of another way (besides for drilling) to
strap this on tightly? Is there another kit I can buy that is better
than the one I bought at RS?
Oh....and there is NO other place to mount the antenna on my roof.
The chimney is the only place.
Any help will be greatly appeciated!

I had a RS mag mount at one time, (before it was literally ripped off my car!)
and it performed quite well at VHF-Hi and UHF. Any antenna that can be put
outside the car will improve performance greatly. A mag mount antenna also has
the benefits of using the car's frame as a ground plane also. One can even
make a omnidirectional mag mount antenna partially directional by placing the
antenna on different part of the car.

One other thing, I've noticed my 43 receives an inordinate amount of intermod
in the 160Mhz range when searching. Have you experienced the same?

>
>Any other suggestions on what would be a good investment under $500 It could
>be base, mobile, or HH.

I don't have any experiance with AOR scanners, but how about the handheld
AOR model 1000XLT "commincations receiver"?? Coverage of .5-1300Mhz (no gaps,
continous coverage) 1000 channels, AM/FM/W/N, VFO knob, lockout, search, scan,
earplug, caradapter, belt clip, case, AC adapter included, operates from 12VDC.
$419, from Tucker electronics you can probably find it slightly cheaper
elsewhere.

Intermod type interference is a serious problem with any wide-band receiver.
Ask any ham operater with a dual band rig, wide front-end radios grab
everything that's out there, amplifies it, then dumps it into the
tuner to be sorted out. I have awful problems here in Pittsburgh Pa.
with local pagers. These things get into my pro-43, my Icom24-at, my
old bearcat 250, hell, a 1320 am station can be found on my telephone
and computer speakers ! It seems that when the pagers are squawking
all sorts of things get into my radios. Are these things extra dirty
or what ?
In any case, I don't think the problem is unique to the pro-43, just
too much RF out there.

From: pastark@news.delphi.com
Message-ID: <2lbov3$ae5@news.delphi.com>
Source record: 276571
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I don't know about the R-1, but the IC-2SRA is a disappointemnt as far as sensitivity. My Radio Shack weatheradio receives a full quieting signal, while the Icom is very noisy. I tried connecting it to my Cable TV cable, and got nothing on the FM band (probably intermod or overload?) I KNOW there's activity on the CB band around here, but the 2SRA receives nothing. OTOH -- for what it receives, it's neat.

>(I mean can you actually hear anything interesting)?

Yes, by all means, take a scanner to the race. There is plenty to
listen to! Most drivers use UHF (460-470) but there are a few
drivers using 800 MHz. Lists are available at the track for 5.00 or
so. These are usually up-to-date. Frequencies change from race to
race, so be sure to have the latest info. There are some dealers
who advertise in various racing publications who will most likely be
at the races.

I have never had any problem with the chimney mount. I once used it to
mount a 3 element CB beam.

Your straps need to be about 3 feet apart, and you do not want the mast
to be very long, unless you use guy wires. For a fairly large antenna,
10 or 15 feet would probably be ok. Personally, I would add guy wires.

Bill

1618. Radio Shack pro2006 or Icom-R7000 ?

Newsgroup: rec.radio.scanner
Date: 1994-03-06 07:48:57 UTC
From: duli@prony.colorado.edu
Message-ID: <2lc1t9$mks@lace.Colorado.EDU>
Source record: 276425

I am thinking of buying a good quality wideband receiver or scanner before
the April magic date. I have narrowed my choices down to RS pro2006 and
Icom-R7000. I would like to hear comments about these two reveicers. I am
fairly new in listening anything above 30Mhz, so please pardon me if my
questions are too simple. I have read specifications of RS pro2006 and
Icom-R7000. I am leaning towards the 2006 because I am a little tight on
budget. I would like to know what I will miss if I don't buy Icom-R7000?
I know that the R7000 has wider receiving range and finer tuning steps, and
SSB capability. My questions are:
1. Is there interesting things to listen above 1.3Ghz?
2. What I will miss if I can't receive SSB?
3. How important, practically speaking, is the finer tuning steps
of 0.1Khz and 1Khz in AM/FM/FMn listening?
4. In terms of performance(sensitivity, selectivity), can the 2006
be put into roughly the same class as the R7000 in comparable
receiving range?
5. The R7000 seems to have a lower scanning speed than the 2006(which
is not very fast either). Is the R7000 a little pain to use when
one wants to scan certain frequency ranges?
I would appreciate any advice I can get. Thanks.

Most people seem to think so. The best short answer I have heard is that the R7100 is a real communications receiver with many scanner features, while the AR3000A is a real scanner with some of the features of a communications receiver.

I have an AR3000A and am quite happy with it, though I here that the ScanStar control program (a good but inexpensive piece of software) while it works well on the older 3000 model does not work quite right on the A model!

If you want convenient MOBILE operation as well as base, the AR3000A is the way to go.

A fellow named Carter Bennett <carter@cmptrc.lonestar.org> may still be maintaining a file on net discussion of the AR3000 (all models). Email him and ask him about it.

>my Pro-43. I find that the '43s regular duckie works better on 400 and
>800 MHz. Can anyone else comment?
>

Interesting. I just posted an opinion of the Condor into a topic with that word in this newsgroup a few days ago... I was quite happy with the Condor antenna in my rural setting on my AR1000XLT compared to a few other antennas I tried (the AR1000XLT stock antenna is *really* bad). OTOH, it didn't make a whole lot of difference that I could tell compared to the stock whip that comes with the MVT-7100. The stock whip is definately better below 50Mhz, and the two seemed about equal even in the bands to which the Condor is tuned...

My impression is that the Condor is a very "narrow mission" device. In certain situations, and with certain equipment, it does make a difference, but not every where, or for every one...

Comments: Those frequency's listed in pairs may or may
not be used as pairs. Sub-audible tones have been
provided where available - these are especially useful to
minimize interference if your receiver offers CTCSS receive
capability. Most fast food establishments use three (3)
frequencies: one for the customer, one for the clerk, and
a third which is used as an internal "intercom". I've found
the best listening to occur on this "intercom" channel.
This is where fast food employees make most of the
"uncalled for" and off color comments about we the
customers! Good Listening!

In light of the current Clipper initiative, it occurs to me that this may, in fact, be their very intention....

Getting PGP will not solve the problem. I feel our government intends to:

1. provide a somewhat viable encryption standard with a govt backdoor.

2. pass laws which make it illegal to use non-govt sanctioned encryption.
(after all, if you are innocent, what do you have to hide?)

The problem cannot be resolved by getting a backing for PGP (or your favorite
encryption algorithm), but by supporting the idea that (real) encryption
should not be an illegal activity.
The government has the ability to get virtually every piece of private info
you have (via wiretap, access to financial data, warrants, lock picking
abilities, etc.) but with the advent of cheap processing, anyone can now
lock information and the Government can't pick the lock.

The standard argument has always been '...in the national interest...'
The question becomes:

"Do we really want to give up the last sanction of privacy left to us?"

This is where I believe the real issue lies.

CB> KI5SR hard to get rid of disco.

out here in san jose california, we have what are called "code 33" tones.
whenever an officer is in a sensitive situation or there is an emergency, a
1/2 second tone is transmitted every 8-10 seconds over the air to alert the
other officers of the channel status. it keeps the other units not involved
in the incident from keying up and possibly covering the transmission of an
officer who desperately needs help. they're used for all sorts of situations,
from gang fights, car wrecks, and code-3 fill requests and officer down calls.
i'll usually just have the scanner on quietly some nights and wait to hear the
tones. i know it's gonna be good listening when the tone kicks in.

I'm about to get either the AOR AR1000XLT or the Bearcat BC2500XLT.
I like to know more about the BC2500, as I've read quite a bit about
the AR1000. Anyone know the dimensions of the BC25000? Step size?
AM W/N FM? Overall quality etc.
I've read some posts re: intermod dist. with the BC2500. How does it
compare with the AOR1000 in this area? Thanks

```
: I don't have any experiance with AOR scanners, but how about the handheld
: AOR model 1000XLT "commincations receiver"?? Coverage of .5-1300Mhz (no gaps,
: continous coverage) 1000 channels, AM/FM/W/N, VFO knob, lockout, search, scan,
: earplug, caradapter, belt clip, case, AC adapter included, operates from 12VDC.
: $419, from Tucker electronics you can probably find it slightly cheaper
: elsewhere.

From everything I've ever heard, the AOR 1000XLT is ok if you live out in the
country but is next to useless in a heavy radio environment due to intermod
and apparently poor signal discrimination.
```

I had and loved a aor1000xlt. (I understood how and why it was
designed the way it is. I suspect that lack of understanding is what leads
to some being frustrated with this radio.) I live in a high rf enviroemnt
near the metro Atlanta area. No problems with the Aor1000. It had an
attunater switch that allowed me to cut the sensitivity if intermod became
a problem. I wish this darn Pro 43 had such a switch as the 43 has far
more grief then the aor1000 ever had! On occasion in traveling in the
metro area I came near a FM broadcast tower that would get into the
scanner in the wrong areas making scanning impossible for s couple of
miles. I believe the near field was so strong that any broadbanded radio
would have problems in these locations.
The biggest problem with the aor and Yupiteru and similar radios
from Japan that have a built in delay that is impossible to defeat is
that they are next to useless for monitoring trunking. Like it or not
trunking of many frequencies is on the rise and may show up in the 70cm
band as well soon. IMHO the best product to monitor this currently
available is a fast scanner with small switchable banks. That leaves only
the Pro 43 and the Pro 2006. I could hear the 800 MHZ ps saftey frequencies
with the aor1000 but I can follow them fairly well with the pro43. To
much was missed with a scanner with the delay to make it enjoyable and
pleasant to use in this area.
The Aor1000 xlt is an interesting radio. If it fits what you want
to monitor buy one ($400 or less). Be aware that banks of channels in
groupings of 100 are extremely cumbersome to use in normal scanning
situations and can be frustrating when breaking events involve only a few
channels that you want to concentrate on (it takes a long time to lock
out the other channels).

Source record: 276438

George Thurman <gst@gagme.wwa.com> writes:

>I am trying to help someone find the output frequencies of the Kansas City
>(MO) police department.

Hello George,

Here are the very basics, I have posted a 900 line list to CompuServe's Hamnet called KCFREQ if you want the big picture.

KC {D:

154.71 North
154.74 South
154.86 Center
154.89 SE
155.85 Tac 1
156.09 East

They have also been working on an 800 MHz system for over a year. To the best of my knowledge, all that has migrated to it so far are the dog catchers and garbage trucks. However, PD and FD are going there according to sources. I live 50 Mi N of the airport so do not usually hear the 800 MHz system. It is on: 856-860.2125
.2375
.2625
.4375

There are also some 460 freqs used for covert ops. This is only KC MO freqa, the suburba, and Kansas City Ks are another posting. Look up the 900 line list on CI$ if you can.

Enjoy!

Question, do you have the narrow sw filter engaged by pressing the top
button on the left-hand side of the unit?
There's a company in Germany modifying their Yupiterus by adding this
filter. Comes stock, and can't be added to a unit made by this
particular company.
I can't remember the name, but they are located in Schwaben, I think.
That sure would be a nice adjunct to the thing.

Going to be interesting when the sun spot sycle hits its high point,
won't be long, methinks, the last peek was about '82.
Big Mac chompers are going to be disappointed when they get chicken
macnugets (tm) having received the request from 900 miles away.
Or, the unsuspecting person gets an order when there's no car present.
Or, even when the 7-year-old talking into the microphone is replaced by
a bass requesting black coffee.
Doesn't bear thinking about. (grin)

ira@src.dec.com "Ira Machefsky" writes:

> Does anyone have any experience using the Yupiteru MVT-7100 on
> shortwave broadcasts? Does it perform credibly in that range?
>
In a word, yes, it performs quite well, given its advantages, and
disadvantages.
These are empirical observations, not backed up by data. But, I have had
a good deal of experience with a number of portable unites, and have
come to the conclusion that this is one of the best.
It will hear as good as any portable unit I have used, this is including
the small 9-band Sony with analog tuning. I have regarded this as one of
the best little units for tracking foreign broadcast.
But, the sony has some what better selectivity, than the 7100.
But I have not found this to be a serious problem.
However, I understand, now that the unit as supplied by a company in
Germany is supplied with a 2.5khz filter for shortwave which is
switchable.
The normal mode is very wide, perhaps about 12khz. Also of help is using
a pre-selector ahead of the Yup. This will cut down on the intermod that
results from the front end getting swamped with signal over load.
I have had this unit for a year, now, and have no desire to sell it,
unless Yupiteru come out with something even more spectacular.

```
Macintosh Amateur Radio Software - March 1994
Version 1.06

Please feel free to distribute this list as widely as possible. Many
of you have asked if it is OK to cross-post this list? I don't mind,
but I would like to know where it is going. If you think it should
be cross-posted to other USENET groups, please let me know so I can
try and manage these. We don't want to have any duplication or our
welcome will be wore out! I will also try and honor individual
requests for this list... but I do not always catch all of the
newsgroups postings... so please DO NOT reply/ask there! If I am a
little slow in getting the list back to you... hang in there!

Those of you that can tell me about ANY of these programs
compatibility with System 7 would be appreciated! I am going to be
adding a System 7 compatability section to EACH description in
future releases. If the application is KNOWN to execute properly
under System 7, the System 7 anotation will be placed as the last
line of the product description. More clarification on levels of
System 7 compatibility in the future editions... but this is a
start!

Some of the information in this list was gleaned from flyers
supplied by the software vendors, or in some cases from reviews in
amateur radio publications or the README files included with the
archive. Some of the information has not been verified for a long
time; please check with the vendors/authors for the latest product
specs, pricing, etc.

NEW/CHANGES: A new group has been added... that of WEFAX. Although
some of the software currently available supports this mode, RadFax
is the first to be listed as the only function of receiving waether
facsimille.

I've started adding more version numbers so that our users will know
if they have the most current release. Thanks to those that have
already sent them in... I'll accept all corrections!

This list contains info on updated for several applications: updated
information on Kantronic's Host Master(thanks John-WD1V) and Lar's
newest release of Morse Trainer 1.1.1. Ivo-ON1XK and Adam-PA2AGA
both contnue to be busy with new releases of IM/Mac and NET/Mac
repsectively. I know that Adam made changes to support the multiport
serial boards... and now we can have up to 16 TNCs connected!
```

Thanks Adam, Ivo and Lars for some great products!

A reminder that The World Software Tool and Dye, is one of the newest site carrying the Mac Ham Radio Software. Scott-WY1Z is maintaining these file as the Librarian of the Boston Amateur Radio Club. Look in the following path at ftp.std.com: /pub/hamradio/mac.

Check at the bottom of this list for more information on ftp'able sites carrying Amateur Radio software.

The ARRL ListServer is also carrying the latest version of this list... in case you loose this one!

*** Collections ***
<MacNet v5.31>
Join MacNet and get included in the latest version of "Macnet Roster", a HyperCard 2.x stack that now has > 400 members and is the proverbial "Who's Who" of hams using Macs. You'll find "Macnet Roster" a great tool for finding out who, what and how other hams are using their Macs with their ham stations. It even includes this file!
Send $30.00($40.00 DX) check or money order to: WD1V, John Seney, 144 Pepperidge Drive Manchester, NH 03103 USA.
All disks shipped First Class Mail PPd. Get the COMPLETE Macnet Software Collection ppd. on 10 disks!
Based on your interests, you'll also receive public domain shareware received by our members.
System 7

<Project Mac>
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many of the programs. Most of this software is now available in the MacNet collection. Send three formatted 800K Macintosh disks with stamped, self-addressed disk mailer to Stan Horzepa, WA1LOU, One Glen Ave., Wolcott, CT 06716-1442. Stan can be reached at horzepa@gdc.com
NOTE: Stan has indicated much of this software is "old" and may not work on some newer Macs. Also he notes that most of his collection is available in the MacNet collection above. He will send anyone what he has if you send him the disks and SAS mailer.

<Amateur Radio Software for Macintosh>
Extensive catalog including logging, Morse code, gray line, test preparation, satellite tracking, contesting, and packet radio programs.
ZCo Corporation, P.O. Box 3720, Nashua, NH 03061. NOTE: This company has been rumored to be out of business!

<Amateur Radio #1>
Contains satellite tracking, Morse code, attenuator design, and Ohm's law calculator programs. Kinetic Designs, P.O. Box 1646, Orange Park, FL 32067.

*** Test preparation ***
<Ham Test Stacks>
HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests. The current releases are: Novice v4.1(new questions eff. 7/1/93), Technician v4.0(new questions effective 7/1/93), General v2.4, Advanced v2.4, Extra v2.4 If you wish to receive these PUBLIC DOMAIN stacks, please send a SASE (self addressed STAMPED envelope - 2 ounces postage = .52) and 800K diskette to the author: Diana L. Carlson, 3 Spruce Street, Hudson, NH 03051. Diana will no longer send out the stacks unless the envelope has sufficient postage for return mail (in general, that means .52-.98, depending on size of envelope) and for those who send a standard business envelope, she takes no responsibility for the condition of the diskette through US mail. Available via anonymous FTP from various sites, including uxc.cso.uiuc.edu (/pub/ham-radio). NOTE: The newest releases of Novice and Technician stacks are available at uxc.cso.uiuc.edu (5/6/93) Author is available via Internet: dls@genrad.com
System 7 savy with HyperCard 2.1

<MacHam>
Test generators and study aids for the Technician, General, Advanced, and Extra class written elements. Includes the complete question pool for each license. Hypercard based.
Coyne Co., P.O. Box 2000-200, Mission Viejo, CA 92692.
System 7 with HyperCard 2.1

*** Morse code practice ***
<N6MZV Morse Trainer>
Lets you practice any combination of letters, numbers, and/or punctuation characters. Can send user-created text files.
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014. Also available via anonymous FTP from ftp.apple.com (/pub/ham-radio).
Shareware.

<Morse Code Tutor v1.6> - used to be called Morse Tutor
Sends random groups of letters, numbers, and/or punctuation characters. Available via anonymous FTP from ftp.apple.com (/pub/ham-radio). Or send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer to Jack Brindle, WA4FIB, 726-175th Street SW, Bothell, WA 98012; Compuserve: 73365,606.

<MorseMania V1.0>
Designed for those already familiar with Morse code who want to improve their speed. Allows code practice at various speeds and audio pitches. Can generate random sequences or play the contents of user-created text files. Freeware. Available via anonymous FTP from whirlwind.stanford.edu (/pub). Contact Edward Plumer, KM6IQ, for more information; Internet: plumer@isl.stanford.edu.

<MacMorse>
Randomly sends chosen characters. Lets you create your own practice

files. David A. Kall, 700 Marine Parkway #314, New Port Richey, FL 34652.

<MacMorse v1.3>
MacMorse is designed to help you learn Morse code and improve your receiving speed. It has several ways that it can send letters and punctuation. Shareware. Doug Havenhill, Dynamics and Control, 7143 West Sunnyside Drive, Peoria, AZ 85345.

<MacSamuel>
Sends random words, random character groups, and user-created text files. Can also create simulated QSOs with randomly generated text and callsigns. Avant Systems, P.O. Box 5437, Pittsburgh, PA 15206.

<Zihua Morse>
Designed to teach Morse code to beginners and to improve the accuracy and speed of advanced users. Responses can be typed into the computer; the program will calculate accuracy and timing statistics for each session. Optional speech synthesizer reads the characters out loud for an accuracy check. Zihua, P.O. Box 51601, Pacific Grove, CA 93950.

<Sparks-II v2.0.5>
More Code training program. Available for anonymous ftp at rahul.net /pub/davidj/radio

<Morse Master v1.0>
The newest of the morse code training programs. MM calculates the real speed as follows: Real speed = Number of Words/end time - start time. And the lengh of word is generating randomly, so if you set even 5WPM, sometimes another value will appear. However you should believe the slidebutton's value. If you repeat many times, the average speed should be 5WPM (if not... anyway, believe the slidebutton's value). Archive is available mac.archive.umich.edu, path: mac/util/organization/morsemaster1.0.sit.hqx The author can be reached thru the following e-mail addresses: h79261a@kyu-cc.cc.kyushu-u.ac.jp. (Eiji AOL account is no longer valid - moved back to Japan after his studies.)

<Morse Trainer-US v1.1.1>
MorseTrainer is a powerful tool for learning and training Morse code. Features: Three different training modes: user text, random text, library text; Arbitrary signal pitch and timbre; Arbitrary speed and tempo; Multi-alphabet support; Random text generator; Text library editor; On-line alphabet; On-line manual; Help Balloons; And a lot more. New features in 1.1: Enhanced sound generator, volume control and risetime control. The pitch is set in steps of 10Hz instead of using MIDI frequencies; Speed and tempo limits increased to 80 words/minute as a result of the enhanced sound generator; User-selectable font in the Misc settings dialog. FREEWARE!
This version uses TrueType fonts instead on bitmaps fonts so that

the user can distinguish 0(zero) from O(character). Furthermore speed and tempo can be given in either characters/minute or words/minute. Archive is available mac.archive.umich.edu, path: mac/util/organization/ Author is available via internet: sund@tde.lth.se
System 7 savy

<CW Speed Builder v3.0>
This program is for improving Morse Code (CW) reception skill. The major difference between this and other Morse Code training programs is that this one will not continue sending until you provide the correct answer. Major changes which have been suggested and implemented since last version include: after three incorrect responses the program shows the correct character; the list of characters at the end which will show those you know and those you need more practice on; the frequency of the tone has been changed; volume of the tone has been reduced; the character " - " has been added (dah dit dit dit dah) Comments can be sent as follows: America Online:K7UPJ, Internet:k7upj@aol.com, Packet radio:K7UPJ@KA3T, Compu$erv:70521,2356, Mail:Box 84, Cascade, MD 21719

*** Packet and other digital modes ***
<NET/Mac 2.3.38>
Allows simultaneous TCP/IP, AX.25, and NET/ROM connections. Requires a TNC with KISS mode. Copyright, but free for noncommercial use. The latest releases have added the ability to cut and paste from the console window and support of multi-port serial boards like AE's QuadraLink. It is now possible to have up to 16 TNCs connected up to a Nubus Mac!
Adam van Gaalen, PA2AGA, (Internet: adam@IGG.TNO.NL) has been making the modifications to NET/Mac. This version (and others) is available via anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming), mac.archive.umich.edu and
System 7

++##NOTE##++
Adam recently sent oout a note to the distribution list about moving NET/Mac to Systerm 7 Pro. If you are contemplating this upgrade, Adam would like to know this... he would like to know about any particular features that System 7 Pro supports that you think should be added to NET/Mac. Please e-mail him at the address show above.

<Domain-to-Hosts Converter 1.0r3>
This application will create a hosts.net file from the domain.txt file that PC owners use with NOS. Created by Ken-NS1C is available on many TCP/IP packet switches in New England.program.
System 7

<IM/Mac 1.0b27y>
Mailer program for use with the SMTP protocol. Alternative to the

BM program that comes with NET/Mac. Written by Ivo van Ursel, ON1XK. Ivo is continuosly updating his mailer program. His newest release supports built-in BinHex support, selectable sound chimes for incoming mail, "quoting" of forwarded messages and lots more. If you are not using this program... why not? Check for the latest release in the directory before "blind" ftp'ing. This software supports System 7's Ballon Help and is System 7 savy! Available via anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming). Author is available via internet: on1xk@igg.tno.nl <<-- new address for Ivo
System 7 savy

<SoftKiss 1.8>
Control panel device that emulates a TNC running in KISS mode. For use with packet-radio modems such as the Baycom kit and PacketMac Modem. Version 1.8 July 9 1993 update since 1.6. KD6PAG found a bug in quoting recieved escape and end characters is sofktiss 1.6. The bug and the fix and patch are all correct, thanks for some great detective work. Lots of doc files and drawings included in this archive! Requires the Serial Tool from Apple's Communications Toolbox! Available on the HAMNET forum of Compuserve, America Online and via anonymous FTP from akutaktak.andrew.cmu.edu (/aw0g).
System 7

<PacketMac Modem>
PacketMac Modem kits can be obtained from: Sigma Design Associates, P.O. Box 49085, Colorado Springs, CO 80919, (719) 260-5513 (after 1/94). Dexter Francis can be reached at FRANCIS4@AppleLink.Apple.COM

<Savant 1.0.1>
A new packet terminal front-end by the author of Virtuoso. Savant has a split window interface, but it's also a multi-window, multi-connection interface and will work with almost any TNC, unlike MacRatt or HostMaster. Savant also is compatiple with SoftKISS and the PacketMac Modem.
A demo version of the product is available at cpre1.ee.iastate.edu (pub/ke0ph) or via US Mail, send a SAS disk mailer and disk to CM Technologies, Inc., RR#1, Box 83A, Kelley, IA 50134 (515) 597-2051.
System 7, 32-bit, '040 cache clean and it supports the required AppleEvents.

<MacRatt with FAX>
Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes cable. Advanced Electronic Applications, P.O. Box C-2160, Lynnwood, WA 98036.

<Host Master 1.2>
The Kantronics Host Master software provides an easy to use, multifunctional terminal program for the TNC. Host Master Mac is a simultaneous multi-mode terminal program for the Mac written by Kevin Krueger, N0IOS and marketed by Kantronics. It is a commercial

product available from most of the ham radio stores and supports single and multiple packet connects, packet monitoring, and HF operation (with KAM) each on a separate window, all at the same time. This package retails for $69.95 in the US and is intuitive, friendly, and well supported by Kantronics. Current version as of 10/20/93 is 1.2. It is hoped that a future version will support FAX but currently Hostmaster supports PACKET, AMTOR, RTTY, PACTOR (KAM ver. 6.0), CW, and NAVTEX. Features: text and binary file transfer; packet conferencing; color or B&W windows; cut, copy, paste between windows; call exchange and data/time stamp; auto startup/shutdown commands; transmit buffers for each mode; simultaneous dual port, multiple connects; supports KPC-2, KPC-2400, KPC-4, KAM and Data Engine. Requires: Macintosh Plus w/ System 6.05 or better. Current Kantronics firmware.
System 7 compatible, with baloon help

<PacketTracker 1.05>
PacketTracker ver 1.05 is a program that monitors packet activity and keeps track of what is going on. It draws a graphical map showing who is talking to who and displays statistics of all current stations and keeps a running tally of activity. PacketTracker was written for both the casual packet user and the network manager or BBS operator. The casual packet user will be able to learn a great deal about what is happening in packet around him; which stations are generating the most data and what some of them are. he will be able to see graphically what stations he can hitdirectly and which ones he cannot. For the network manager and BBS operator, PacketTracker provides extensive insight to the operation of the local network and problems such as excessive retries on a path. It also allows for extensive logging of channel utilization and other pertinate information.
NOTE: This application requires the Apple's Serial Tool from the Communications Toolbox.
System 7

*** RTTY ***
<MacTTY>
Decodes Baudot or ASCII transmissions. Can also be used for packet radio and other digital modes (including landline data communications). Includes split screen, a 15,000-character type-ahead buffer, and canned messages. Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.

<MacMultiCom 1.0>
MFJ sells MacMultiCom 1.0 for their 1278 multimode controller. MacMultiCom supports all of the modes of the 1278: packet, rtty, ascii, pactor, amtor, gray scale faxes, and many different formats of color sstv. The program requires a minimum of a MacPlus and a hard disk. Requires a color Macintosh and System 7 for best results.
System 7

*** Logging *** <Ham Radio Station Logbook>
HyperCard stack that stores and displays radio contact information. Automatically stamps entries with time and date. Contacts can be sorted by frequency, call sign, or date of contact. Includes report formats, a "Q-code" reference list, and on-line help. SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523.)

<FDLog!>
Contact logging and duping program. Can transmit any of ten programmable CW messages. Generates real-time statistics on QSO rates. System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

<MacContest 4.0>
The ultimate contest logging program for the Macintosh (System 7 proof). Covers CW/SSB/RTTY modes and all bands from 1.8 MHz to 5.7 GHz. Allows real-time or post contest logging for a wide variety of contests (30 contest include, new ones can be added). Checks for dupes, figures scores instantly. Offers various printouts (sorts per band, alpabetically, labels etc.) Interfaces to TNCs (KAM, PK-232) for CW, RTTY and packet modes. Built in terminal mode and packet DXcluster interface. Interface to Kenwood transceivers for automatic band/mode logging. MacinTalk voice output for real-time logging as well as to ease post-contest entry. Option to capture log in realtime to printer. Option to simultaneously create a save copy of the log to a different file/drive. Timetable showing actual grayline on a world map.
MacContest is free but must be personalized to each user (otherwis it's limited to 50 contacts). To get a copy send a 3.5" diskette and a SASE to Gerald Eberle, HB9CEY, PO Box 13, CH-4417 Ziefen, Switzerland.
Moritz (HB9BLZ) can act as a message forwarder for Gerald. Moritz' e-mail address is: gysslerm@saturn.kau.roche.com

<LOGic>
(Macintosh version scheduled.) Lets you define the rules determining dupes (such as once per band or once per contest). Displays heading, distance, and other information about the country being worked. Automatically enters contact time; if interfaced directly to a radio, also enters the frequency, band, and mode. Shows status toward earning amateur-radio awards. User-definable database fields. Exchanges data with other programs. Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.

<HF Logger 1.2>
A real fine HyperCard logging program! (hey... thats all I got!)
N0QGQ

<Simple Log .2b>
This little utility is a handy way to create a logging file that you can later import into any data base for analysis, etc. It also

shows you that just about anyone can use Think C and create
something on the Mac! Let me know if you'd like the source code.
WD1V @ WA1WOK.NH.USA.NA Author is John Seney - WD1V, e-mail address
is jseney@aol.com. For a copy of this program, mail a SASE disk
mailer and 800K disk to: John D. Seney, WD1V, 144 Pepperidge Dr.,
Manchester, NH 03103
System 7

<Marathon>
Contesting/logging- Have seen references to (March 92 CQ magazine)
and heard good things about MARATHON by N 0 IOS. I believe a demo
was available for $8. Last address known is: Kevin Krueger, N0IOS,
1780 Ruth St., St.Paul, MN 551O9

*** Propagation, gray line, DX headings *** <DX Map v1.1>
Displays a map of the world with the terminator. Gives location,
prefixes, zone numbers, distance, and heading for any country you
select. Freeware. Requires HyperCard 2.0. Available via anonymous
FTP from joker.optics.rochester.edu (in the /ham/dxmap directory).
Or send a formatted 800K Macintosh disk with a stamped,
self-addressed disk mailer to Len Saaf, NV2Z, 52 Raleigh Street,
Rochester, NY 14620 (Internet: saaf@joker.optics.rochester.edu).

<SatTrak>
Primarily a satellite tracking program, but also calculates beam
headings, Maidenhead grid locations, MUF plots, and band openings.
Shareware. Available via anonymous FTP from sumex-aim.stanford.edu
(/info-mac/app). Or send a formatted 800K or 14.MB Macintosh disk
with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ,
6207 W. Beverly Lane, Glendale, AZ 85306.

<Sun Clock>
Desk accessory. Displays a color map of the world, including the
terminator. Indicates current time for any location. MLT Software,
Inc., P.O. Box 368, Portland, OR 97207.

<DX Window>
Draws a great-circle world map centered on your QTH, with day/night
terminator indicated. Displays over 400 DX locations with prefixes
and beam headings. Engineering Systems, Inc., P.O. Box 939, Vienna,
VA 22183.

<Skycom 1.1>
Enter solar flux and get propagation predictions to desired areas
of the world. Engineering Systems, Inc., P.O. Box 939, Vienna, VA
22183.

<Skycom 1.5>
Provides sunlight status at both ends of a path; MUF, F0F2, and FOT
frequencies; S/N ratio of the link; and other information.
Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<DX Helper v1.57B>
Displays beam heading, distance, gray line, and propagation information. Generates great-circle maps. Identifies prefixes, zones, and oblasts. Includes code practice. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98336.

<Mac MiniMUF v5.1>
A greyline and propagation predictor based on the PC version of MiniMUF by K4CFV. It is available directly from him for the price of a formatted disk and SASE (disk mailer). His address in callbook or: Bob Stamper K4CFV, 12510 Shadowrun Blvd., Riverview, FL 33569

<Mac ShortWave v1.2>
A program called Mac Shortwave that figures MUF and LUF. BXA Research in Plano, Texas

*** WEFAX ***
<RadFax 0.9>
RadFax 0.9 is somewhat incomplete and may have bugs, it is capable of receive weather faximile messages via the sound input port of Macintosh computers. Basically you connect your Mac to a shortwave radio and tune in to weather fax station. You set the reception speed and desired resolution and start receiving.
I'm not sure if I'm going to add the features that I still feel are missing, but if I get enough shareware payments, I will do so. In any case, anyone who send me a shareware payment of $25 (cash prefered, but I guess there might be a way for me to cash checks too) will receive a disk with the full source code for the program. You will need at least Think C 5.0 and TCL to compile the program. Shareware payments should be sent to: Juri Munkki, Ehrensv 20B8, SF00150 Helsinki, Finland

<WeFaxWorks>
Weather facsimile terminal program for use with Kantronics TNCs. Kantronics rfconcepts, 1202 E. 23rd Street, Lawrence, KS 66046.

*** Satellite tracking ***
<SatTrack v1.02>
Tracks one satellite across a world map as it moves, displays the instantaneous position of several satellites, or generates tables of all satellites visible from a certain location at a given time. Also calculates beam headings, Maidenhead grid locations, and MUFs. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

<MacSat v3.1>
Tracks up to 21 satellites simultaneously, either in simulation or real-time mode. Text screen displays ground-track coordinates, range, mean anomaly, visibility (azimuth and elevation) and Doppler shift frequency information for all satellites being tracked. Graphical screen portrays the satellite ground tracks superimposed

on a world map. Polar plot displays graphically the precise location of each visible satellite above the observer's horizon. Developed by the Geodetic Research Laboratory of the University of New Brunswick. Available from Richard B. Langley, R.R. 12, Fredericton, N.B. E3B 6H7, Canada (Internet: lang@unb.ca). A demo version of MacSat may be ftp'ed from directory PUB.CANSPACE on unbmvs1.csd.unb.ca.
System 7

<OrbiTrack> <OrbiTrackFPU v2.1.4>
Calculates look angles to selected satellites, plots current satellite positions on a world map, and displays the visible passage of a satellite against background stars (either within the program itself or via a data file that can be read into the Voyager astronomy program). Please note that one version requires an FPU to operate! BEK Developers, P.O. Box 47114, St. Petersburg, FL 33743. (Bill Bard, CompuServe: 75366,2557) (Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)

<QuikMac>
Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC. AMSAT, P.O. Box 27, Washington, DC 20044.

<Satellite Orbit Prediction Program>
Macintosh conversion of W3IWI program. Requires Microsoft BASIC. Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

<Satellite Pro>
Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

<Macintosh Spacecraft Personal Orbit Computations (MacSPOC)>
Software used aboard the Space Shuttle and in Mission Control to track the Shuttle. Models engine burns, orbit perturbations, and the Shuttle's orientation. Free online data uploads during Shuttle missions.
Commercial v1.5 available from Daniel R. Adamo, 4203 Moonlight Shadow Ct., Houston, TX 77059; telephone 713-480-9631; AppleLink: D3176; America Online: AdamoD. Test drive v1.1 available on AppleLink (path "K-12 Education: Education Resources: Science Resources: MacSPOC: Space Shuttle Orbit Software"). Author is on AOL and can be reached as adamod@aol.com via the internet.

*** Antenna design ***
<MacMiniNEC>
Chris Smolinski, N3JLY, 40 South Lake Way, Reisterstown, MD 21136.

*** Radio control ***
<ICOM Radio Control>
Provides a Macintosh interface for controlling ICOM transceivers that use the CI-V remote-control system. Lets you quickly change frequencies and modes. Also does logging and duping. Requires a CI-V to RS-422 converter (schematic included with program).
KE6FG Software, 9763 Pali Avenue, Tujunga, CA 91042.

<FreqValet>
Provides frequencies and DX program info for shortwave radio listeners. The program databases update automatically at 15, 30, or 60 minute intervals, thus providing a continuous display of broadcasts on-the-air at any given time in a spreadsheet like format. Features include sorting of data, scanning, and on-screen changing of databases. The program will convert Tom Sundstrom's dBase shorwave broadcast listing to FreqValet format and will do the same for Shorwave Navigator users. Separate cards are provided for DX Programs, Ship to Shore, and Utility broadcasts. Computer control modules are available at extra cost for the Drake R8, Kenwood R-5000, JRC NRD-525, and NRD-535 receivers.
DX Computing, 232 Squaw Creek Road, Willow Park, TX 76087.
Telephone (817) 441-9188 or (817) 441-5555 (fax). Author is available via internet: dxcomp@aol.com System 7 with HyperCard 2.1

*** Ham radio BBSs ***
<Digikron Systems BBS>
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

<N8EMR BBS>
Various ham-related files, including packet, DXing, and contesting software; AMSAT bulletins; and several ham newsletters. (614) 895-2553. Also available via FTP on AMPRnet at 44.70.0.1.

<WB3FFV BBS>
Various ham-related software, including packet, contesting, and Morse code applications. (410) 661-2475, 661-2598, and 661-2648.

<ChowdaNet BBS>
(more info at a later date)

Mickey R Henniger (henniger@crl.com) wrote:

: Getting PGP will not solve the problem. I feel our government intends to:

: 1. provide a somewhat viable encryption standard with a govt backdoor.
This is unnecessary, why create a backdoor when you have the key? All
clipper keys are in the posession of our government with no LAWS to
protect them. Clipper is probably secure except for the fact that the
keys are all in "their" hands. see sci.crypt or alt.security.pgp

: 2. pass laws which make it illegal to use non-govt sanctioned encryption.
: (after all, if you are innocent, what do you have to hide?)
This is a possibility. A scary one.

: The standard argument has always been '...in the national interest...'
: The question becomes:
: "Do we really want to give up the last sanction of privacy left to us?"
No!

OBradio: I mentioned it before but got no responses, is the use of PGP
verification acceptable on packet?

cheers,
Dan

1639. Q: Radio & TV receivers/scanners with GPIB or other ?

Newsgroup: rec.radio.scanner
Date: 1994-03-07 16:47:32 UTC
From: U211321@HNYKUN11.URC.KUN.NL
Message-ID: <16F72FA35S85.U211321@HNYKUN11.URC.KUN.NL>
Source record: 276445

Hello Netpeople,

I was wondering if by any chance there has evolved some sort of
Personal Computer remote control standard for radio and TV equipment,
like e.g. the GPIB interface for analogue measurement equipment 15 or
more years back.
I know nowadays you can buy TV-receiver cards for the PC which may
or may not be sufficiently shielded, what I do know is that with
soundcards the noise situation can't possibly be bettered without
making the product substantially more expensive and I guess this
holds for anything inside a PC processing HF and higher frequency
analogue signals.
Any radio & TV sets out there with GPIB or its successor ?

Thanks in advance, Bob.

1640. Best call you've heard

Newsgroup: rec.radio.scanner
Date: 1994-03-07 17:44:48 UTC
From: s1312800@SANDCAST
Message-ID: <1994Mar7.174448.15175@spartan.ac.BrockU.CA>
Source record: 276446

The title says it all. I want to know the best police/ambulance/fire etc. call or scanner conversation you've ever heard.

For example, I think the one I most enjoyed was the time that the emergency task force of the Niagara Regional Police was called out to a house in the city, because a kid had shot and killed his friend and had holed himself up in the house. It lasted for about two hours, and it was quite exciting.

Either that or the time I heard my neighbour call 1-976-SEXX...

Any comments?

1644. Antenna problem SOLVED!

Newsgroup: rec.radio.scanner
Date: 1994-03-07 18:57:53 UTC
From: rbishop@oasys.dt.navy.mil
Message-ID: <2lftfhINNmku@oasys.dt.navy.mil>
Source record: 276450
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I recently posted a request for help with an antenna problem I was having. I had placed an outdoor scanner antenna on my house to enable my BC55XLT to get better reception of nearby railroad activities. However, when I hooked my radio to the antenna the unit lost almost all sensitivity and picked up fuzzy broadcast band type signals. This I interpreted to be front end overload from what I had read. This turned out not to be the problem, however.

I received several emails with suggestions and one asking what kind of cable I was using. I was using RG-58U and I was told that that was probably my problem and that I should try RG-8U instead. This past weekend I changed the cable to RG-8U and my problem was solved. Gone are the interference problems and the radio now picks up strong, steady signals from what used to be spotty sources and also picks up from sources that used to be unavailable. Thanks to all who responded (I have emailed thanks to you). And I am posting this so that others who might have the same problems might try this solution.

While I was on the way to a Mickey D's this weekend, a call came out for my local PD that a stolen car had turned up in the parking lot with four occupants. By the time I arrived there, there were three cruisers clogging the lot and a fourth pulled in behind me.

I left the local PD freq (only one--there's 15 cars!) in and added the Mickey D's, but sadly enough, nothing was going on inside the restaurant.

Oh well :(

Doesn't look like it. The 2m amateur band in the US and Canada is 144-148Mhz.
Both freqs Bernhard gave are outside the amateur band. One transmits 'below',
and the other transmits 'above' the 2m ham band.

Jimmy:

I tried to E-mail you but it bounced so here's my letter in a post.

In rec.radio.scanner, PhillipsJ@redstone-emh2.army.mil (Jimmy Phillips) writes:

>I noticed that you were using a BC55XLT, do you know of any modifications
>that could be made to it. Thanks for any help.

Jimmy:

Sorry I've never heard of any modifications for 55XLT's. I imagine that
mods might be hard to do as I can't count the number of times (not
intentional) that my '55 has fallen off of a passenger car window ledge
to crash loudly onto the tile floor of an excursion or tourist line
coach (not nice carpets like Amtrak). The radio must be like a brick
inside. Mine still works great.

Hmmm. Well, I once got this gem from Philadelphia International Airport
[paraphrased, but you get the idea]:

ATC: USAir Flight 927, you are cleared for landing.
Plane: Ummmmm, Tower, did you mean flight 1927?
ATC: Oh, yeah, sorry about that.

Another time the engineer of a train in Chester, PA had called police
because his train had hit something and he thought it might be a person but
wasn't sure. It turned out he had, but it took a while to find the guy.
[They had been on a bridge, and after being hit the man went over the side,
which is why they weren't sure what had happened.] In the mean time, the
police found a large teddy bear below the tracks and had speculated that
that was what the train hit. The following witty dialogue ensued:

Cop: Delcomm, subject is a brown stuffed bear, approximately three
feet in height.
Dispatcher: Roger, will the subject be requiring an ambulance?
Cop: Negative, this will be a DOA.

OK, I don't write much to UseNet but I have a question. Is there such
a thing as a DTMF (Touch Tone) Decoder and what is the price and where
can I find one. I would like to use it on the audio out of my scanner.

Purpose? Well my girlfried uses a cordless A LOT and to check on credit
cards ect. I want to know if such a device exists! If so, then
perhaps in the future I can make her be alittle more reserved in the use
of the cordless. Show me proof, so I can ... adjust her attitude...

Email if you can mosby@cup.portal.com

That's illegal to do that... but what the hell, this isn't the best
i've heard, it was pretty good though... This afternoon I had the
scanner going at work (like I do every day) scanning Police,Fire, &
Ambulance. There was a call on the Police channel to go somewhere
to look for a guy that had just exposed himself to a girl. They gave
the car the usual description of a person then said "with a small
pecker" !!! (or something like that)... sounds like he wasted his
time exposing himself! :-)

Just heard this last night. The local PD dispatched a unit to a house not far from mine for a father who had inadvertently handcuffed his daughter and did not have a key. Several interesting questions come to mind with this. No not that, like how do you inadvertently handcuff someone.

The best i think i have heard was on a friday night just as i was leaving work. I got in the car and turned on the scanner and a PD unit was running a license plate. The dispatcher came back and gave the description of the car and who it was registered to "RO is yoo hung lo" (not exact name but close) she then tried to spell it phonetically she got the first name before she lost it. The whole dispatch was "rotfl" and it ended up taking three dispatchers to get it done.

1667. Tones heard on French two-way-radios.

Newsgroup: rec.radio.scanner
Date: 1994-03-09 12:51:11 UTC
From: esuvy@csv.warwick.ac.uk
Message-ID: <2lkgnv$q92@saffron.csv.warwick.ac.uk>
Source record: 276474

Has anyone heard those series of tones emitted by two-way radios in France?

When skiing in France, the lift-mechanics, ski instructors/guides carry with them radios to keep in contact with the main station.

Their radios emit a series of five or so tones within one second. These tones do NOT sound like DTFM tones. I was just wondering what they are for, i.e paging and is such equipment available for public use. (I have heard some French police carring such radios).

Cheers in advance,

Peter.

When scanning the local police for Raleigh, NC I hear many calls classified as "possible chapter 90 violations". Listening to other information about these calls leads me to believe that it refers to drug dealing. Can anyone provide more information ? It would also be interesting (for me anyway) to know what 'chapter 90' refers to.

One of my favorites so far was the local (VERY local) police
department getting sent to a noisy dog call:

Dispatcher: Car 6, go to <somestreet>, report of a barking dog.
Car 6: Okay, on my way.
<Time lapse>
C6: Car 6 to Base, everythings under control here.
D: What did the dog have to say for himself?
C6: Woof Woof!
D: Hmmmm.... Sounds like a troublemaker, are you bringin' him in?
C6: I don't know, do I have to 'cuff him if I do?
D: Yea, you know the rules.
C6: I know, I know.
D: And don't forget to read him his rights! We can get <Well
known single officer who's dating habits are subject of
a city joke> to interpret if needed, he know's the
language pretty well I understand.

My other favorite scanner treasure was a local neighbor on her cordless
who used to call her hubby a work and tell him all the things she was
doing to herself while wishing it was him. I almost forgot to not take
the scanner into the shower with me once! ;>

I was out with a buddy one night and for some reason (innocent REALLY) the police were looking for us. We heard them anxiously run the plate with the obvious intent of heading us off at my house. They were not too happy when my address came back as a Post Office Box...

Another time, during homecoming at college we heard about a scuffle in an alley. We went down the alley just in time to get several pictures of the police beating a student who was handcuffed. We got away and later put one of the pictures on the front page of the student paper. The police came to get the negatives, but the darndest thing had happened - a cigarette had burned the negatives...

Yet another time, a friend and I were on the interstate cresting a hill in the left lane when we heard a police call saying that a truck was cresting the same hill going the wrong way at a high rate of speed. I swerved over to the right shoulder and missed the truck by a few feet. The guy continued on and ran over a highway worker. Turns out he was in diabetic shock...

Message-ID: <2lkomh$l16@bmerha64.bnr.ca>
Source record: 276480

Can we get away from frequency lists and mod requests
for a moment? I have a minor cordless phone scanning problem in
my neighorhood for which I hope I can get some advice from this
group.

I use a PRO 2006 and PRO 43 to scan the 46 MHz range. Sometimes
there is a "carrier" on 46.970. That is, there is a signal that
the scanner stops on that contains no modulation -- just a very
quiet hiss. I know that this is not an internal malfunction of
any of the scanners because both receive it. By the way I have
a solution: with the PRO 2006, enabling "sound squelch" from
the front panel makes the unit skip over this signal nicely. If
a phone does start on 46.970 then the 2006 will stop, because
now there is modulation (thanks GRE!).

This signal will often appear for days and then vanish for a
few more and then return. Sometimes it is only present for a
few hours and at other times 24 hours a day.

Here are my theories ...

Electrical noise ...
Possible. I live about 1 block away from a huge hospital,
which, in addition to providing some good scanner action
(security etc.), emits a lot of RF noise.

Cordless phone left off hook ...
Possible (happens often enough), but unlikely as there is
no background noise and the signal this week has been
present for some 120 hours ... the batteries on a cordless
phone handset would be dead by now.

Idiot transmitting signal to stop scanner users from monitoring
that frequency ...
Possible, but improbable. Ineffective too.

Cordless phone malfunction ...
Could a cordless phone base malfunction such that a signal
would always be transmitted even if the base unit is not
being used to make a call? That is, could a base unit be
busted in such a way that it is forgetting to "turn off"
it's transmitter?

Digital signal?
At first I thought so because there was a lot of hissing on
this signal. However I attached a longer antenna to the 2006
and this really cleaned up the signal ... very little hissing

now.

Other ?????
???????????????

What do you guys think?

...CPV

One of the more humorous calls I heard was in San Jose. The call went out to PD and fire. A man had run himself over with his ice cream truck. No one was able to figure out how he did it. Turns out he only sustained an ankle injury. -okay so maybe you had to hear it. It's usually the tone of voice that makes it funny. You can tell when they deviate from their routine monotone voice.

Another one I heard the same day was a major hit and run accident, but they found the front license plate at the scene that the offending vehicle had left behind. OOOPS! THey didn't have any trouble finding the guy.

Chapter 90 probably refers to a section of the state law books that detail
drug & narcotics violations. YOu could probably find these books at a library
or law library. In San Jose they call it 11-3 which is section 113xx section
of the penal code. It is rare for PD to refer to the exact violations because
there are almost always multiple infractions (i.e. using, dealing, carrying etc. so they
just refer to all drug violations with a single term like chapter 90
of 11-3 or whatever.

Quoting S1312800@SANDCAST to ALL concerning Best call you've heard:

S1>The title says it all. I want to know the best police/ambulance/fire
S1>etc. call or scanner conversation you've ever heard.

A couple of weeks ago a car was stolen in King City, CA. The car was spotted by a Sheriff's car headed north on HWY 101, about 40 miles away, in Salinas, CA. The chase was on by sheriff's deputies at 75-100 mph. All kinds of police got in on the chase as they headed towards San Jose about 60 miles away.

They called the HWY Patrol, San Jose police, etc. The chase went on for about an hour. The TV news stations even got in on the chase as the news footage on the local channels that evening was one of the highlights. In fact, the police chase cars had some of the other sheriff's cars stop the news team from interfering with the pursuit!

Well, I thought that they would set up a road block in a remote area between Salinas and San Jose but that didn't happen. The pursuit continued into San Jose. Will the local police with the aid of the CHP, sheriff's deputies, and pursuing vehicles get them now as they approach and enter the city? What kind of blockade will be installed, etc.?

No blockade was set up. Apparently, the driver and passengers knew their way around the area. They drove into the city, lost the police on the freeway and abandoned the car in the downtown business area of San Jose! The police don't have a clue, to this day, as to the driver and passenger's whereabouts! The car, a Camaro, was returned to its owner with an extra 120+ hi-speed miles on its odometer.

Needless to say, I'm sure, the procedures in apprehending stolen vehicles during a chase will be reviewed in depth after this incident.

In a previous article, post@130.162.65.80 (James C. Post) says:

>I am looking to buy a rather top end hand-held scanner before the April
>cutoff for monitoring cordless and possibly ???????? phones in addition to
>other misc radio transmissions. I am only a casual observer of the hobby,
>but would like to be more involved. I think possibly I would like the AOR
>1000XLT or Icom R1 but I am open to suggestions.
>
>My problem is that I do not have either a mail order or local (Pittsburgh)
>source for this purchase. Can anyone help me out?

Many people think the ICOM R-1 is a bad "scanner", I have to agree. It has
great bandwith (100Khz-1300Mhz, continuosly) but only 100 memory channels for
this freqency range??? Also, people say it doesn't receive that well
(RFI problems, intermodulation, ect). If I was looking for a handheld I
would consider the AR1000XLT commincations receiver with 1000 memory channels
(stored in EEPROM all your freqs will be kept permentaly in the EEPROM when
the battery is taken out of the radio). A few have said this radio
works best in unpopulated areas and is noisey in the city, however, a switch
setting for the AR1000XLT will limit some of the city noise they have talked
about. Tucker Electronics has a free catalog (800-527-4642, Dallas, TX) ask
for Electronics/radio catalog. They sell two different models of the AR100XLT
the regular for $419, and the Single Side Band Receiver for $459.

BTW, Tucker also sells Sigma Discone antennas, Scanner preamps, and books (like
The Scanner Modifaction Handbook Volumes 1&2), HT, HAM, and Shortwave radios..
I am sure if you look hard enough you can get better prices, maybe from Scanner
World than Tucker..

Well, since we've had the best of scanning, how about the worst?
What's the most annoying this about the scanning/monitoring hobby in your opinion? Somebody mentioned a neighbor with an out-of-band cordless phone, or there is the infamous pagers--but I interesetd more in the people you listen to.

For example, my biggest annoyance is the agency that shares the frequency of our campus police. While I accept that a PRO-43 has no way to decode CTCSS tones and break squelch accordingly, that is not the problem. Many other frequencies I listen to have multiple users, and I can live with that.

The problem is that this agency (it seems to be a private security company) has what must be worst training in radio use imaginable. For example, just about every transmission has the format of
Blue-34 K recieved K enroute K 42nd St K OK? K copy? K ...

Some of their people understand that "K" means "switch to send" but most use K after every single word they speak.

The other thing that bothers me is the fact that this company spends 10 minutes, every shift, to assign meal times and to number the units in the field--after they've already held a face-to-face roll call in their offices. Then they the spend 5 minutes going from post to post making sure that the PSOs are where they belong, a process which is repeating every 15-20 minutes.

BTW, anyone who has a list of the FCC database for NYC, their call sign is something like WQFB363 and they operate on 464.475 MHz. Could you tell me who they are?

Hello all
I have heard several interesting things on my scanner, but I think one of
the best happened just year.
This Milwaukee Police officer was in pursuit of a suspect in his squad car.
All of a sudden there was no communication between dispatch and the squad.
Finally after a minute or two of the dispatcher calling out the squad number
(297-R) the officer came back on and indicated that he just rolled his squad
over and needed assistance in a big way!!!

Hello again
I just thought of another funny scanner moment
One night a sheriff's deputy pulled some guy over who was a Chicago Police officer. I missed some of the conversation but the deputy was getting in over his head so he called the sector-supervisor.
The deputy then asked the supervisor various questions about something special about this person, mainly cause he was a chicago cop I guess.
But this part of the conversation I did get. (so-so scanner at the time)
Deputy: Oh, one more thing. What should I do with the shotgun?

Sector-supervisor: (after a moment of dead air) I wish you wouldnt ask me these questions over the air!!

Talk to you later

Am considering purchase of an Icom R-7100 to use w/ computer control
for listening to general VHF/UHF scanner freqs and searching out new freqs.
Also want to use to decode NOAA images from satellites in the 137-138Mhz

with experience with this rig and any computer-control packages for it.
Best place to send mail is to pscott@wellfleet.com or respond here.
Thanks...suggestions on decoders for NOAA images welcome too- have
AEA FAX now. Bye

you can telnet tcomeng.com login fcc

they have an fcc license database for the using. i tried the wqfb363 and
got nothing. did not try thr freq as they probably have lots of lic users
for it. although you could probably figure it from the freq. note also
that callsigns need to be typed in upper case to work. good hunting.

The database only contains licence data for repeater or base stations in
California. The USA database of mobile-only and portable licences is also
included. A great resource for the west coast ... not much help east of
the Sierra.

i heard a funny one tonight- the dispatcher was trying
to explain that the shots fired were coming from a
car because the r.p. had mentioned the doppler effect.
trouble is, the dispatcher did not know what the doppler
efffect is called nor how to explain it very well.
meanwhile the car is presumably still driving, firing,
and the pitch kept changing.

also, there is a guy in my neighborhood (the castro)
who cruises for men on a one-to-one (also buliten
board) gay sex line. he calls the number very late
at night, after 2am, and stays on for hours, going
from one guy the next, 'getting off on the fone,'
until he finds one he would like to see in person
and then they arrange it. usually on friday and
saturday nights.

Outdated? How did this scanner become outdated? I have the same one,
and in comparing it to friends' newer Uniden and Radio Shack scanners,
I feel absolutely no urge to replace it.

I would agree that the $299 reference price is off base, if that is
what you were referring to.

Ok, this one I'll enjoy, the North Andover MA Fire Department.
EVERY SINGLE STINKIN' MORNING AT 6AM they do a radio check with
about 20 other fire departments in the area! And if they don't
get a response, they retry it then call them! Then just to make
sure it worked, they do it again at about 8pm! Sooooo darned
annoying! What's funny is that some of the other stations have
taken to sarcasm in their responses and the N. Andover folks
DON'T SEEM TO NOTICE! :)

Before I catch heck for this, I don't think it is bad to do the
radio checks, just that if no one else deems it important or
needed to do so, why pester and annoy everyone on a daily basis.
Maybe weekly would be a good time to do it?

|> What's the most annoying this about the scanning/monitoring hobby in your
|> opinion?

Most of my annoyances come from NJSP. They change their control channel around midnight most nights, so I can't leave it on when I go to sleep.

My 2005 can't isolate subgroups in the trunked system. Lots of times, units don't identify the roadway they are on, just the milemarker because subgroup::roadway == 1::1 for a few major roadways. Sometimes they identify routes 78 and 80, but you never know which road they're on when the complete location identifier is 78.3 NSX. With other identifiers being SNL, SNX, SNE, NSO, you would think L means Local lanes on Route 78, X for eXpress, E for Eastbound (after the local and express lanes join together) and W for Westbound in the same area. O could mean "outers" and I "inners" as there are inner and outer lanes on the NJ Turnpike. Maybe I'm onto something here... But why use NS or SN-anything on Routes 78 and 80? They are east-west roadways (end in even numbers, remember!)

In any case, I hear calls from the northern third of the state with the next call coming from God-knows-where.

A couple nights ago, they actually changed the control channel three times in a row at *fifteen minute* intervals, which of course, requires unlocking the previous control channel and locking out the new one. No fun when you've got one bank for two trunk sets totalling twenty channels with two control channels, in addition to other supporting freqs.

And finally, not all antenna locations broadcast all transmissions. As I'm following a conversation through the hops, the reception quality varies with every channel. Very annoying, especially when the conversation goes like this: "345 to 3-Com, get me some backup out here, I've got a.. hold on" [channel hop] "I've got a sssssccccchhhhhhhhhhhhhhhh" [channel hops because the squelch killed it and I didn't have delay on] 3-Com: "received 345. 328 did you receive that?" at which point I usually yell at the scanner, "No!" [channel hop] 328: "that's affirm, 3-Com, I'll be there shortly."

Grrr.

Brett,

I have read alot of you stuff in this group and would appreciate your help. I am looking to learn more about scanners and would like to purchase a "good" one before April.

Since you seem so knowledgable, could you tell me what Marymac is and what MT mag is and possibly give me a few mail order sources for scanners? I am thinking possibly of the AOR 1000XLT, but open to suggestions. I have posted requests before but have not recieved any help from anyone.

In Wednesday's (March 9) issue of the Wall Street Journal, the following article appeared on page B6, "FFC Votes to Provide Airwaves For New Pocket-Phone Industry" by Mary Lu Carnevale.

"The Federal Communications Commission, voting to clear the way for a new pocket-phone industry, gave the boot to police, fire and emergency medical systems from a portion of the airwaves."

The cleared airwaves will be auctioned off for so-called personal-communications services, including pocket telephones.

Safety agencies currently using microwave systems will have five years to install equipment that uses fiber-optic links or operates at a higher frequency.

The frequencies are not given in the article, so if anyone knows any more about this, please post.

I have scanned the article and I will email it to anyone that is interested. Contact me at haston@hap.arnold.af.mil.

Hi every one.
I am new to this news group, so I hope this
isn't a FAQ.
In my area, Sacramento, the banks put a transmitter,
called the Signal 1000 by the sheriff's department, in with
the money that they give to bank robbers. Then, of course,
the police can direction find right to it. The name of the
device, I think, is a local name, but the frequency that it
uses, I believe, is a national standard frequency. Does
anyone know this frequency. I think it is arround 220 MHz.

Thanks in advance - Rob.

++> Just reported to the Norfolk area and I am looking for any Military
++> air frequencies for NAS Oceana and Langley Air Force Base. Any
++> idea where I may locate them.

I may be able to get "THE LIST" from a friend in a couple days,
but here's a few to get you pointed in the right direction.
Note these are VHF only, none of the UHF freq's.

NAS Oceana:
126.2 Tower
119.6 Approach

NAS Norfolk - Chambers Field:
118.425 ATIS
120.7 Clearance Delivery
121.8 Ground
124.3 Tower
119.2 GCA
120.2 GCA secondary freq
126.375 Heliport Tower

Langley AFB:
118.85 Clearance Delivery
121.7 Ground
125.0 Tower
126.7 GCA

Listening to these frequencies you will always here the controller
side of the conversation (assuming that proximity, antenna, etc. are
not a problem). After listening for a while you will here
the controller tell the aircraft to "contact tower XXX.X" for exemple,
then you have that UHF frequency. You can also on occasion hear handoffs
like this from Norfolk Approach, usually on 118.9. I hope this is
useful information.

Scanners-

My friend and I each have a BC200xlt. We both have the same frequecies and such in our scanners. We both have them restored for cellular. The thing is: I can never pick up cordless phones! True, I can always pick it up when I am using my own(phone), but never anywhere else. At his place he can always get some activity. We both scan the same freq.'s also.(46.610-47.000) and (49.000-50.000).

Is it possible that he just lives around tons of people who use cordless? Is there a better antenna out there for people like me who enjoy cordless? Any suggestions would be appreciated.

Brent(brosencr@cwis.unomaha.edu.)

I would like some opinions about the Bearcat 2500 XLT.
I am new to scanning and was impressed with this model
at our local C.B. store. It was spendy $500.00 +. If this is
a wrong choice, recommendations would be appreciated.
I am not a regular reader of rec. radio scanner.
Thanks in advance.

It is a great radio but if you live in a city or very close to one, you will probably have a lot of problems with intermod. When I lived in south San Jose, CA, it had few intermod problems, but when I drove through downtown San Jose, it was terrible. Here in Utah, I have almost no intermod problems. As far as features, and freq. coverage, it blows away all the others (not counting the MVT-7100).

>cordless? Any suggestions would be appreciated.

I used to have a BC200 and found that cordless phone reception was poor with the stock antenna. I could just barely pick up my neighbor. I now have a pro2022 and even with the stock ant the whole block comes in quite well, hooked to a roof antenna, range is even better (1/2 mile). You might try a different antenna, but there may be more to it than that with the BC200.

|> I would agree that the $299 reference price is off base...
^^^^

that's not what he said. yes, I'd react the same if I thought someone wanted
3 bills for a 34.

In any case, I only wanted to replace my Pro34 when I moved to New York City.
It suffers poorly from intermod in high rf areas. I don't think I'll buy any
more double conversion radios. I know, I know, double conversion and sensitivity
are different issues, but when manufacturer's produce triple conversion radios,
they *usually* step up the sensitivity and image rejection. Too bad GRE
approved the image dumping on the Pro43 in the railroad frequencies.

One type of broadband directional antenna you could build is a log periodic
for vhf and uhf, designs for these types can be found in amateur radio
publications from ARRL and others.

The construction of such an antenna is not hard, all you need is some metal
rods, pref. aluminum and a coax.

> Shack? Any reviews?

No review here, but I did get a chance to play a little with the unit.

has service search for Fire, Marine, weather, and something else. Police was
NOT included.

has the usual amount of celluar images above 896 Mhz.

I could quickly tell this model was Uniden made, and the extensive amount of
celluar images confirmed it.

The unit seemed very light. Lighter than my 43, but didn't feel as solid.

Has a large display panel, with characters about as big as the Uniden 200XLT's.

Just some preliminary observations for the curious!!!

Sure, there is usually a way to make an antenna directional.

Are you looking to buy a new antenna, modify one you already have? Where do
you want to mount the antenna? What frequency ranges are you interested in?

I just noticed the other day that my scanner has a gap in it's
coverage that I was not aware of. This gap is from 549.995-760.000.
I would really like to be able to scan this range. Does anybody
know if these freqs can be added back in. I am not interested in
the cellular mod unless it will also turn these on. If any body
knows if the hardware to tune these freqs is in the scanner then
please let me know even if you don't know how to turn them on.
I also would be interested in knowing the opposite (if these freqs
can NOT be added). Thanks.

I think one of the most 'chilling' I heard was many (6-7 years) ago while
visiting my grandmother in Baltimore, MD. The call was for a train
'derailment'. One engine, one ambulance, and one squad truck if I remember
correctly on the initial dispatch. This turned out to be the Amtrak/Conrail
wreck in Chase, MD. You know something is wrong when the first unit on the
scene asks for 30 medic units and the dispatcher asks again to make sure
she heard correctly.

1725. Best call you've heard

Best Call I heard was on the local NYC fire bands - when the fire was In my own building and my wife and baby and I were wondering what to do...from the scanner we found out that the fire was several floors away, and therefore we did not have to go out into the smoke-filled hallway, but instead wait for the firemen knock on our door to tell us it was ok. It is an eerie feeling at 4am listening to all the trucks that are rolling up to your building, though.

Then, while waiting in a safer apt. several floors down, we listened to the fire dept describing their salavage and clean-up while watching them in action.

It almost convinced my wife that the scanner (pro-43) was worth what I paid for it.

And by the way, FYI, even if you know the fire dept has already responed to a fire in your apt. building/hotel/neighbor's home, you should still call 911, as they will relay to the firemen in the building that you are waiting (to be rescued!) in your apt.

All fire depts I am aware of run a radio check (unit check) at least once a day. If I don't want to hear it I can lock channel out temporarily. BUT...It is useful in checking propagation such as ducting. It is perfect for identifiying key frequencies in areas you happen to only occosaionaly travel to. Police call sometimes leaves alot to be desired in listing the frequencies and unless you know 154.280 is a mutual aid channel and 153.xxx are usually low power fireground frequencies if many other are listed you have know idea in some cases which frequency is F1 until you hear the routine tests. Some fire depts operate on weird freq. not readily apparent or even posted in Police Call, hearing the check during a band search will quickly tip you off as to these 'secert' freq.

These checks aren't so bad for most scannists, are they?

Message-ID: <LINNIG.94Mar12104250@m2000.dseg.ti.com>
Source record: 276385

I've noticed that some of the public service agencies around here, primarily paramedics, are fond of using ETOH as slang for an intoxicated person or an alcohol related accident.

Have you folks noticed this usage? I'm curious if it is a political-correctness issue for the paramedics. Why not just say alcohol?

I guess an overheard emergency call to Senator RedFace's house would attract less attention if ETOH was mentioned than if booze was involved.

Just curious.

> Is that the celluar looklike/window mount type of antenna?

No, it advertises "No visible antenna whatsoever.... Mounts in
seconds, using your entire car body as a giant, efficient
1-1000 MHz all-band antenna." I realize that they're not gonna
say, "Works marginally OK!" in their ad, but for occasional use
it might be adequate for my purposes.

Thanks,

>>Have you folks noticed this usage? I'm curious if it is a
>political-correctness

They say "ETOH" for liability reasons, I guess. ETOH is the chemical formula basically for alcohol, but there are times when a patient could be exhibiting signs of being drunk, when in reality it is just some sort of medical imbalance NOT caused by consuming liquor. Dispatching the run using "ETOH" instead of "drunk" reiterates this fact to the medical workers, even though (at least around here), the "ETOH" people really are just DRUNK!

The police don't seem to care, however, & anyone staggering down the street is referred to as being "drunk" until proven otherwise.

Also politically correct, when paramedics are dispatched to handle someone who is either known to be HIV +/AIDS, or who for some reason they think might have it, they include the phrase "universal precautions" when dispatching the EMS unit. Paramedics are always supposed to take universal precautions (gloves, & other techniques to try not to come into direct contact with someone else's fluids), but this 'code phrase' is specifically given when they have reason to believe (often through previous contact, I guess) that the person has some sort of communicable disease.

The above is all accurate for my area, but certainly policies, procedures, & 'code phrases' will vary.

There is a neat new service in the S.E. lower Mi area that is a must for all scanner nuts. It's called the Fire Notification Network of Michigan.

What is it?

It is a group (currently 230) of scanner freaks and news people who send out pages of major fires and police happenings on alpha numeric pagers. We list the radio frequency to tune to and a brief synopsis of whats happening. We have members of the media and police and firemen on our network as well as plain old scanner heads. We also are tied into fire pages from L.A. , Chicago and New York.

This all can be yours for a one time fee of $10, $12/yr dues and $11.50/month for the service and pager. You may use the pager for personal use too. There are options available too, like voice mail and statewide coverage too(additional cost)
Call Garry at the network (810)772-4423. Sign up today and enjoy the fun.

>when the fire was In my own building and ...

>we found out that the fire was several floors away

>It is an eerie feeling at 4am listening to all the trucks
>that are rolling up to your building, though.

>we listened to the fire dept [..] while watching them in action.

Yes, it is freaky to watch them surround your building. Last
summer, I took advantage of NYU's summer housing program, and the
first night there taught me a lot about the city.

Early in the evening, I would listen on the dispatch freq and watch
them pull up to buildings up the street. Finally, when I was sleeping
they pulled up to mine. Before I left the apartment, I heard a signal
92 (malicious false alarm) so I stayed put. About 10 minutes later, a cop
banged on my door with his flashlight. He told me to GET OUT, and asked
me if I heard the alarm. I replied to the affirmative and added that I also
heard it was a false alarm and went back to sleep.

Sure enough, I got to the ground floor, and a fireman asked the same question.
I looked dead at him and said, "YES! But it's a SIGNAL 92!!!!" I walked
to the opposite corner, stood for about 30 seconds and they cleared our
re-entry.

Near the end of the summer, full length scaffolding that had been secured to
the top of the building directly across the street from me had broken free on
one end and was hanging by one(!) rope. (The lower end was about six floors
down!) I didn't hear the dispatch, but I certainly heard the tower units.
That was the night I found the fireground freqs. I had some friends pile
into my room since my apartment was on the 14th floor and the other building
was 15 floors.. perfect view. I have never had better front row seats.

It was really fun as firemen entered a series of apartments and secured the
scaffolding to the building at each floor. Then one leaned out the window
and as we saw him grab his shoulder speaker-mic, he says, "can someone
get ridda that dog?" I looked to street level and a loose dog was walking
around right at ground zero! The woman who called it in was on the 13th
floor and the scaffolding clipped her window air conditioner as it was
swinging side to side from the initial fall.

Guess it doesn't make you feel any better to know that ten years ago their Pro-34
handheld had the buttons for Scna, Manual advance and Speed selection on th ek eyboard and
clearly across the top of the frame so you could easily push them w/o looking even if it was on you belt. Even the belt clip was beter then as it was spring loaded like a Motorola beeper. Guess they're regressing huh?

I'm looking for a scanner that is easily modifiable (for
cellular reception). I've heard alot about the PRO-43 from
this news group but not a whole lot on the BC 2500XLTA. Is
is just because it's fairly new? Anyway, which is best
for cellular and what about step size? I've heard the
Bearcat assumes a step size of 30khz when the cell is
unlocked. Is this true for the Pro-43?

Any help is appreciated.

Thanks

Scott

: of course where all my local (NYC) police depts reside.)

: Is there a fix for this?

: Does anyone have a similar problem with this radio? Last night I
: compared it side by side with the PRO-37 that I sold to help pay for
: this puppy, and it was fine while the Yup was dying!

Funny you should mention this! I just now returned from a drive
across the Cross Bronx Expwy (I-95). I programmed the northern
Manhattan and Bronx NYPD freqs (476 MHz range) into my MVT-7100
and was blasted by pager interference from Paterson NJ to New Rochelle
NY. Turning on the attenuator didn't help.

Rather than intermod, it sounds like image-response interference.
I'd expect intermod to respond to the attenuator.

The only fix I can think of it an external "trap" filter to block
reception of signals from the paging transmitters. Such a trap
would affect reception of desired signals, too, unfortunately.

Good listening.

If you used a sharp notch filter - like a shorted tuning stub, then
you would not lose any other desireable frequencies, unless the pager
frequencies were in a band segment that you desired to monitor.

John,
I owned an AOR AR-2500 for about 2 weeks - the length of the "return if you are not satisfied" warranty made by AOR. It was simply T-E-R-R-I-B-L-E! There were frequencies in most of the major service bands that were totally unusable due to intermod and images. These were from pagers and semi-local low power educational FM transmitters as well as the major market FM broadcaers. The radio had nice features like computer control and logging (with a record of signal strength received - nice!), but the overall performance made the radio simply unusable in my fringe suburban environment.
I sent mine back and received a no questions asked refund (not sure if this is still the policy) and bought an ICOM R-7000. Never regretted it one bit. If the ICOM R-100 is one half the radio the big brother R-7000 is, then it is ten times the radio the AR-2500 was. The R-100 may not be the answer to your needs (few of these wide coverage LW -to -daylight radios are), but it has to be better than the AR-2500.
A suggestion. You might do well to consider buying a nice SW portable (Panasonic RF-B65, Sony SW-55 or Grundig YB-400 are all good) and a Radio Shack PRO-43 scanner. For something like the same investment as the R-100 you'll have a darn good scanner (best for the $$$) and a very nice SW radio. Good luck and let us know how you do.

In a previous article, s1312800@SANDCAST (AARON ROSSETTO) says:

>The title says it all. I want to know the best police/ambulance/fire
>etc. call or scanner conversation you've ever heard.

I would have to say my most memorable reception would have to be
an aircraft emergency at the local Air Force base. While testing
a C-141 Starlifter the pilot realized that the left side main landing
gear didn't retract completely. I listened as they did did phone patches
with Lockheed engineers in an attempt to get the gear to move one way or
the other. After several hours of circiling the field they got the
gear to working and landed safely.
I also live fairly close to a Military Operations Area(MOA) so hearing
F-15's F-16's doing mock dog-fights is an every day thing. And occasionally
you can catch a Marine Harrier doing mock attack runs.

In a previous article, amullick@vaxc.stevens-tech.edu () says:

>Well, since we've had the best of scanning, how about the worst?
>What's the most annoying this about the scanning/monitoring hobby in your
>opinion? Somebody mentioned a neighbor with an out-of-band cordless phone,
>or there is the infamous pagers--but I interesetd more in the people you
>listen to.

For me this would have to be the time a local police officer was dispatched to a burglary in progress. 10 minutes later the dispatcher asked if he had arrived on-scene. He informed the dispatcher that en-route to the burglary he had witnessed a car make an illegal lane change and he pulled her over. The officer of the day proceeded to chew his butt and his defence was that she wasn't using her blinker.

1753. Funny Scanner Stories

Newsgroup: rec.radio.scanner
Date: 1994-03-14 05:25:07 UTC
From: gregm@ccwf.cc.utexas.edu
Message-ID: <gregm-130394222507@slip-12-1.ots.utexas.edu>
Source record: 276410

Here's a recent scanner story. This occured last Saturday night.

EMS Communications> Dispatches Starflight, Medic 11, Aid 6, and Westlake First Responders
"CPR in Progress, 5 year old male"

Westlake 1st responders out on scene

"Westlake 26 to Austin, Cancel all responders"

EMS Communications> "Westlake 26 repeat your traffic, Are you advising cancel??"

Westlake > "Affirmative"

EMS Communications> (With incredulous voice)"We had a report of CPR on a 5 yo male."

Westlake > "Affirmative, the patient is a CAT"

EMS Communications> "A what????"

Westlake > " The patient is a five year old cat."

EMS Communications > "Received, canceling"

Loses a little in the transcript, but was quite hilarious on the air.

1754. Nuts and Volts magazine

Newsgroup: rec.radio.scanner
Date: 1994-03-14 05:30:58 UTC
From: pgunn@alkali.otago.ac.nz
Message-ID: <pgunn.138.763623058@alkali.otago.ac.nz>
Source record: 276411

I'm posting this again as the news server downstream from me packed a sad recently and I'm afraid that it may not have travelled more than 1 hop. Apologies to those who did receive this before.

I keep seeing references to the magazine 'Nuts and Volts' on this group and it sounds very interesting. No libraries in New Zealand (or Australia) seem to hold it, so I can not interloan it to look at it. If it is as goods as it sounds, I'd get a subscription to it, but I'm not prepared to get it on just vague good feelings about it.

I would like opinions and details on this magazine. Can anyone out in 'net land help me ? Anything would be nice, price, size and format, ratio ads vs articles, summaries of any good articles that have turned up in the recent past.... An address of the publisher would be nice as well.

How relevant is it to scanners ? Does it service the radio end of the spectrum (excuse the pun) or all of the electronic market ?

Does it have gossip and innuendo or reviews or dissections and schematics ?

A serious technical journal or a light weight tabloid ?

Any opinions gratefully accepted (I'm still not sure if this is getting out past the news server at Canterbury, so I'll happily read replies from anywhere saying 'Never read it, but i got your message' :-)).

Thanks in advance.

Email replies preferred for obvious reasons. I know that email works.

Are you certain you're not getting a birdie? Try going up or down
.05 mhz. In other words, if it happens on 46.65, change your
channel to 46.60 or 46.70 and see if it still happens. You should
still be able to hear any actual transmissions on 46.65.

>with it. I primarily scan rail frequencies (160-161 Mhz), but have also
>used it in the 46 Mhz (cordless phones) and the 450 Mhz range as well. All
>have been with improved results over the duckie the scanner came with.

I got a mag-mount Radio Shack antenna for scanning rr freqs. too, using a
Pro-42 scanner. Maybe the Pro-42 is just too wimpy a scanner to realize the
benefits of the antenna, but I haven't noticed much difference in reception
quality and range over the duckie.

Someone was telling me that for scanning 160-161 MHz, the antenna ought to
be about 16 inches long. Anyone know if this helps? The mag-mount is
considerably longer than this.

Well, just so people not in the know don't get misinformed, it's actually
CH3CH2OH (the #'s should be subscripted, didn't know quite how to get
that across). The Et or ET is a shorthand for Ethyl (CH3CH2-), which is
used commonly but I have not seen it in textbooks. BTW, I hate O-Chem!!!

Since the purchace of my new pro-51, I have been scanning communication between Houston and the Space Shuttle Columbia. IT is quite interesting. Even as I type they are in the process of changing their orbit from a higher to a lower so that they can make further tests, but with the interfearance of atmospheric elements.

The shuttle is currently directly above the straights of Gebraulter, and in their eleventh day of flight.

I am recieving this at 146.92000 Mhz for my area if anyone else is interested.

This issue comes up almost every shuttle mission. The shuttle audio is being re-broadcast by a locat Ham club. Many areas of the country have Ham clubs that do this. you should be able to search 144 - 148 MHz and find it. As a matter of coincidence, I stumbled onto the shuttle audio last night by accident. I didn't even realize that there was a mission going on! I just thought it was some hams playing around with their latest equipment purchases. :-)

Nuts and Volts would probably not be very useful to folks outside the US. The majority of the rag is ads for surplus equipment vendors and vendors of cable/satellite descramblers. There is an occasional article of interest but editorial content is not the primary purpose of Nuts and Volts. It is distributed for free at most radio/electronics stores in the US.

>it so it would scan the cell freqs. Does anyone know the program instructions
>that were used to do this and are they available for various phone models?

I came across this while briefly subscribed to a cell programming mailing list. Someone posted steps to reprogramming a certain brand phone. The idea of converting a cell phone into a scan mode seems a simple way to deal with lack of modifiable scanners soon to come. I posted a while back with this Q but noone would bite. What I would like to know is where information about such mods are located. Scanner mods are comparatively easy to find. With some cell phones going for next to nothing in the used market, it seems like you could have a lot of bang for the buck.

1764. MOD's for Pro 46???

From: post1@ID1.AL.ALCOA.COM
Message-ID: <post1-140394101540@132.226.102.82>
Source record: 276422

Any one able to compare these two? I have seen the MVT-7100 referred to as the "best" unit available, but have also heard great about the AOR1000XLT. Only "bad" thing I've heard about the 1000XLT is it abilities in the city (switch to cut sensitivity is suppose to correct problem). I am going to purchase one of these within the next week and am open to comments.

Also, I am having a had time finding a source for the MVT-7100. How do you contact Javiathon in England? Is there any other source for the MVT-7100 possibly US based?

Any help is greatly appreciated!

>quality and range over the duckie.

I have a BC55XLT, whose duckie was/is really lousy. I could only hear
about 4 milesif I was lucky. With the RS Magmount, I can pick up
about 25 miles easily. It also depends on which unit the dispatcher
is using, and how good the radio in the engine is. I can often hear
N/S traffic 30+ miles away, but it seems that they use stronger signals
than CSX here in the D.C. area. I also had picked up a collapsable
center loaded portable antenna from RS last week which is much improved
over the duckie, but dosen't come close to the magmount (of course
neither duckie or telescoping antennas do anything INSIDEthe car :-).

> Someone was telling me that for scanning 160-161 MHz, the antenna ought to
>be about 16 inches long. Anyone know if this helps? The mag-mount is
>considerably longer than this.

I came up with 73.2 inches for a full wave antenna at 161Mhz (someone
please correct me if I'm wrong). This would work out to about 18 inches
for a quarter-wave antenna. I tried this length with the RS magmount,
but did not see the performance that I expected. It came out about the same
if not worse than with the full antenna with both loads. I tried
various combinations one evening and based my conclusions on the signal
comming from a defect detector about 3 miles away and another about
10 miles away. This eliminated the difference in radio power from the
locomotives.

Hope this helps........

Hello everyone...

Well I'll try to look into this... I am already planning to try
to make some mods to the mvt7100...The problem is that Im afraid if I break
it I wont be able to get it after april 26...
Does anyone know if there going to still ship the Japanese models??
or if Yupitera is going to make another model???

things I would like to make mods for....

1. make the keyboard lock switch a permanent on light switch...
2. Try to unlock all freq steps for all demodulation schemes..
(this should take some pretty hefty reprogramming of
the eeproms...)
3. try to make the banks like regular banks bank 1 starts with
memory 100....

4. add a filter for listening to cw...
5. and Now adding shielding...

Couls someone who has opened thiers up let me know I would like to know
of any difficulties, etc....

oh by the way how is the pro39???(cell modifyable???) my wife to be
wants a scanner YEAH!!!!

happy scanning...

In article <2lrgn3$rek@pipeline.com>, mccready@pipeline.com (Gary McCready) writes:
|>Best Call I heard was on the local NYC fire bands - when the
|>fire was In my own building and my wife and baby and I were
|>wondering what to do...from the scanner we found out that the
|>fire was several floors away, and therefore we did not have to
|>go out into the smoke-filled hallway, but instead wait for the
|>firemen knock on our door to tell us it was ok. It is an eerie
|>feeling at 4am listening to all the trucks that are rolling up
|>to your building, though.

This happened to me Christmas morning a few years ago. After an evening of light partying, I got to bed around 3am. At 5am I heard my neighbors' smoke detector go off. I figured they'd burned some toast or something, but a minute or two later I was brought fully awake by the sound of my fire department pager going off to announce a full box alarm for the townhouse next door!

I looked out my back window and was greeted by the sight of a virtual blowtorch coming out of the basement of the unit next to mine. I called 911, identified myself as a firefighter, and suggested a second alarm be staged. The dispatcher just said, "we're already doing that; now shouldn't you be leaving?"

Lacking any gear (it was all in the station), I helped out as best I could from the outside, thowing ladders and changing air bottles and such. It was very strange, watching my next door neighbor's unit go up in flames and seeing smoke pouring from my own roof's vents. I listened to it all on my pager, the firefighter half of me analytically assessing the situation while the homeowner half wondered whether I was going to lose everything.

By 7am it was all done but the paperwork... my neighbor's unit was a total loss, I had a good bit of smoke damage, and the unit on the other side had smoke and light fire damage. Total losses around $200,000.

Its probably a 6 meter ham radio operator echoing satellite reception.
So people like you and I can listen in.

1776. Portable antennas???

Hey everyone...

I was wondering if any knows of a commercially available coil antenna
rubber duck style that can be used on am broadcast and some of the
other sw stuff....

I have a mvt7100 and hate having to pull out that 21 foot antenna just
to recieve am broadcast a hundred miles away....

-thanks

Where can I got a copy/subscription to "World Scanner Report"?
I'm interested in comments about using HB-232 on a Pro-43.

Dave Martin - dkm@col.hp.com

1778. Re: WORST call you've heard

Well, this was before "scanners", but some of us had little
3-6 transistor convertors. They would mix 154.whatever (~1 Mhz wide) down
to the broadcast band (~1 Mhz) and then you would slope tune on your AM car
radio.

The worst call *I* heard was when the cop chasing me in my hot rod Chevy
actually got my whole plate correct and asked for stats. Hmmmm, thought
I had camoed the plate better with tape than that.

Six movers and a night in jail.........

A friend of mine had the second worst. While parked in the middle of
Nowhere, Iowa with his girlfriend, he hears his plate being called in.....
About 3 seconds later, the stealth cop lights up the area.....

Pre-scanner daze......

Bill

Neat story! Just out of curiosity, what does a "box alarm" signify. They use the same terminology around here (Southern MD, Northern VA).

I would suggest the Bearcat BC 200XLT. The cellular restoration is simply unsoldering a little resistor, the only problem is that it searches in 12.5khz steps instead of the 30khz that the cellular band uses. I can't say that this is really a big deal since there is so much traffic the radio can still pick up literally dozens of frequencies.

Emil H. Gallant - egallant@borland.com - Views expressed are mine.

- |> > Plane: Ummmmm, Tower, did you mean flight 1927?
- |> > ATC: Oh, yeah, sorry about that.
- |> >
- |> Actually, this sort of thing happens a LOT more than one would hope.
-
- I'm sorry, but as a pilot myself, I fail to see why this exchange is
- interesting at all, much less as the "best call you've heard."

What kind of a pilot are you? When in the pattern many pilots pay some attention to the designations of other aircraft in the same airspace. The change from 927 to 1927 is non-trivial and some cause for concern if the controller makes the mistrake. Imagine there WAS a flight 1927 and he started onto final based on this mistake.

CRUNCH

- Slips
- of the tongue happen all the time, to everybody. What if you were
- listening to the local police frequency and heard the following:
-
- Cop: Dispatch, I'm gonna be 10-6 at Winchell's on Main Street.
- Dispatch: Ummmmm, did you mean Elm Street?
- Cop: Oh, yeah, sorry about that.

Not quite the same impact (no pun intended) since there is no danger of running into another police car with catastrophic results because of the error.

- Would you consider this exchange to be your new "best call I've
- heard?"

Mine would be when tower at Capitol City Airport advised a Chinook to delay final as he had just "cleared" a flight of seagulls to cross 27 on the way to compass rose. The stoopid [tm] birds always go where and when they please and this was Jerry's (Tower Ops at the time, about 1975) way of dealing with it. The drivers at the chopper repair/recondition depot were used to it. A stranger listening in might think there was a certain loss of sanity involved. Actually, knowing Jerry, there was :)

But I don't believe it will receive SSB, will it?

1783. Bearcat 220 repair help

Newsgroup: rec.radio.scanner
Date: 1994-03-15 02:55:40 UTC
From: mgarrett@prairienet.org
Message-ID: <2m383c$se3@vixen.cso.uiuc.edu>
Source record: 276340

I have a Bearcat 220 radio that was given to me to repair. I
only a "P" display and several dots on the display and the squelch still
operates. I have replaced one burnt transistor (unknown which one since
I do not have a schematic) and have checked all of the caps on the
processor board in efforts to find a short. From what I can tell the
is drawing a lot of power on the processor board since the 7917 in the corner
of the board gets smokin hot. I am suspecting the processing chips as the
culprits. Does anyone know if these Ic's are still availible? And if so
at what costs?
If anyone has any ideas to check out on this unit, please drop me a line.

This freq looks like it falls into the business band (IB), so there is no
telling what it is. My guess is that it is some type of telemetry, giving
information updates. On the other hand, it could be some type of packet
comms. Look at the FCC database and compare the logitude and latitude
coordinates.

FOR IMMEDIATE RELEASE
FROM: Scott Ehrlich, Software Librarian

FOR FURTHER INFORMATION, CONTACT: Scott Ehrlich, WY1Z
Tel: (617) 373-4198

PLEASE DISTRIBUTE AS WIDELY AS POSSIBLE

MARCH 15, 1994

WORLD HAM RADIO ARCHIVES MOVES TO OAKLAND

Due to a recent policy change from Software Tool and Die's
Internet computer system, the World, the ham radio archives from
World have moved to the very well-known anonymous FTP site of
oak.oakland.edu (141.210.10.117).

The directory on Oakland where the files will be locate will remain:
/pub/hamradio.

The Oakland FTP site permits a maximum of 400 simultaneous
anonymous FTP connections, so there should be plenty of space for
everyone to access what they want, when they want.

The directory structure on Oakland will remain the same as it was
on World.

If you have any questions, please feel free to contact me.
My e-mail address is: wy1z@netcom.com.

1788. ETOH in parmedic slang

Newsgroup: rec.radio.scanner
Date: 1994-03-15 18:03:00 UTC
From: gregory.halpin@bitbytes.clark.net
Message-ID: <e5.2115.143.0NE0A1DF@bitbytes.clark.net>
Source record: 276345

L>I've noticed that some of the public service agencies around here, primarily
>paramedics, are fond of using ETOH as slang for an intoxicated person or an
>alcohol related accident.

L>Have you folks noticed this usage? I'm curious if it is a
>political-correctness
>issue for the paramedics. Why not just say alcohol?

As an avid listener, and an emergency service provider (firefighter),
I'll jump in.

It is also used in my area, and probably the explanation that I would
give would be that the intoxicated subject would not understand this.

Now, I'm sure you're asking, if the guy's drunk (or the gal, don't want
to exclude the lady drunks!), he already knows it; why try to keep it a
secret from him?

Well, some persons, upon hearing themselves referred to as being
"intoxicated", will become violent, disruptive, and/or destructive. But,
hospitals need to know that they are receiving an intoxicated patient,
due to the influence on the patient's condition and diagnoses, as well
as any special arrangements that need to be made at the hospital
(security, etc.).

So, when an EMS provider notifies the hospital that they have a patient
with ETOH, the drunk says "Wow, I wonder how bad that is" rather than
"This SOB is calling me a drunk; I'll show him who's drunk"!

Plus, the gathering citizenry doesn't hear a provider notify a doctor
that their patient his an odor of alcohol on the breath, but rather that
an odor of ETOH is present. Some crowds can get unruly when they find
out that someone is drunk, especially at an accident scene. "That
)^%&$^%(is drunk, and now my baby's hurt! I'm gonna kill him!" is not
something you want to hear at an incident.

Does that make sense?

"H-and-S" is what's used in these parts -- for Health and Safety Code violations -- for drug calls. Although illegal fireworks are also an H&S violation, they're not coded that way. :-)

There are many since I have been a ham and a 'scanist ' for
years. But today I was reminded of an event a few years ago.

I was falling of a mountain on I-24 when I was supprised to see
two Tn State Troopers working radar at the bottom. I had slowed down when
the radar detector went off but my brakes were smoking quite badly. BOTH
these guys came off the shoulder with their lights on and I groaned.

As i was prepared to pull over they shot past me and I finally
heard on the scanner that they were concerned about a fellow in a black
trans am that had killed a grocer in a small store in Georgia and was
last seen heading north into Tn. All of a sudden these two state police
cars pulled a rolling drop of the interestate, across the grassy median
and shot up on the other side drivng straight into oncoming traffic! Guts!
Traffic stops and as I pass I see a black trans am with 2 cars in front
of it and several behind it. The driver out on the pavement with several
shot guns pointed at him as he lay there.

Fifteen minutes later I hear on the scanner that the poor fellow
they had stopped was a tourist from Kentucky and he was merely on his way
through Tennessee on his way back home. Wrong suspect. I bet this guy
NEVER drives through Tennessee again if that is how they treat tourists!

.....

That reminds me that the state police are big on shotguns.
Another quick story involves the time I was working out of Maryland for
Southern States Coop. I was supposed to fuel at their Fredrick Md terminal
which was home to a fleet of fuel tankers used to transfer heating oil and
other fuels to farms. This included a seed and feed warehouse and store
and a shop covering about five acres bounded by two country roads that
joined in a fork about one half mile away. I had keys to the big chain
link fence so I could pull in an fuel. I stopped out on the highway and
walked into the compound after unlocking the gates. I though I would turn
on the floodlights as it was duck and it would make my turn into the
property safer. As I started in the warehouse door I noticed it was open!
There was a lantern about 30 feet in there shing away from me. I thought I
would be blown away any second by the thieves as I was easly seen in the
doorway. Having not been shot I quickly but quitely ran back to my tractor
trailer and picked up the mike to 75 watt 2 meter radio and called for
help. A general assigned to the Pentagon who was at home for the evening
heard the call and he called the Maryland state police barracks.
You should have seen the responce! As far as the eye could see
there were blue and red lights coming. They must have pulled every cop in
thirty miles! The first in were tow state police detectives and the
pulled in a screaming slide, jumped out with drawn guns and braced the

warehouse. The hollered "Maryland State Police, come on out!"

No responce.

A bunch more were in postion now and finally two of the braver ones dived through the door in different directions. After a bit the lights came on in the warehouse and then several angry officers came looking for me. The had found the lantern and no intruders. The wanted to know what kind of hoax I was running making that radio call. I assured them I was on their side and I had not played a hoax on anyone. I showed them my Id. and other papers an after a couple of minutes they calmed down and issues instructions to all to commence searching for the felons who may have hidden while I made the radio call.
These Maryland troopers are all 6 foot 6 inch with huge hats and these guys were on the roof, walking across these tank trucks flashing lights held at arms length while they trained their guns inside of each tank compartment ready to shoot or be shot. Tension was getting high.
Then they found their man. Up front a team opened the sales office
I found a teenage employee with his back to the door calmly working on his motorcycle. The hollered freeze Maryland State Police and he jerked up in startled fright. They promptly thrust a shootgun into his back and told him that if he moved again .....

By this time SS Coop employees and the general manager had arrived. They had all heard the action on their respective scanners at home and jumped in their cars to race to the scene to see what was going on. It was quickly determined that the young employee had had trouble with his bike and had gotten permission to work on it after hours. He had used the lantern to light the warehouse as he moved the bike out and walked it up to the warmmer front building where he could work on it. He rememebered he had forgotten the lantern but since he was securly locked in for the night he felt it didn't matter much anyway. You can figure out the rest.

He did mention to me later that when the state police shoved that shotgun in his back that he was so frightened that "if he had been a black man , he would be white today" just from the scare he had.

1794. 200xlt Performance Inquiry

Newsgroup: rec.radio.scanner
Date: 1994-03-16 02:24:00 UTC
From: Ken.Ota@f239.n109.z1.fidonet.org
Message-ID: <48a_9403160048@blkcat.fidonet.org>
Source record: 276352

The BC200 steps at 12.5kHz and the normal cellular spacing is 30kHz.
You miss quite a few channels because of this. I've played with a
PRO43 side by side with a BC200 and there is a significant difference
in the number of channels you can pickup with the proper 30kHz steps.
You can run a spread sheet to see how many times the frequencies match
up when stepping 12.5kHz versus 30kHz.

1795. Scanner clubs in florida???

1796. Ham Radio FTP area on World

Newsgroup: rec.radio.scanner
Date: 1994-03-16 04:00:10 UTC
From: wy1z@netcom.com
Message-ID: <rec.radio.info-ham.radio.ftp_763790409@ve6mgs.ampr.ab.ca>
Source record: 276354
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.info,rec.radio.scanner

This is a periodic reminder that the Boston Amateur Radio Club maintains an FTP area on world.std.com (192.74.137.5) in pub/hamradio.

This area is accessible via: anonymous ftp, gopher, and World Wide Web (and possibly other methods I'm not yet aware of). World is not *fsp*-able yet (I asked them).

Via Gopher, the easiest path to the area is by selecting the following from World's main menu:

18. Membership and Professional Associations

3. Boston Amateur Radio Club

And go from there...

Please feel free to browse through the area.

If anyone has any questions about it, please do not hesitate to e-mail me.

Also, up-to-date copies of the files on the ARRL's information server (info@arrl.org) are available in the directory pub/hamradio/ARRL/Server-files.

All text files are uncompressed, so they are both retrievable and viewable via Gopher and World Wide Web. (If you have any troubles with any text file, please e-mail me).

Source code for programs is always welcome. It can permit people to use those programs on other computers with other operating systems.

Scott

1797. Re: ETOH in parmedic slang

Newsgroup: rec.radio.scanner
Date: 1994-03-16 04:50:43 UTC
From: gkd@wpi.WPI.EDU
Message-ID: <2m6373$np2@bigboote.WPI.EDU>
Source record: 276355

In article <2lu1n2$4hb@umcc.umcc.umich.edu>,
>
> They say "ETOH" for liability reasons, I guess. ETOH is the chemical
>formula basically for alcohol, but there are times when a patient could
>be exhibiting signs of being drunk, when in reality it is just some sort
>of medical imbalance NOT caused by consuming liquor.

They also use the term when within earshot of the patient so that the
(drunk) patient doesn't hear them telling medical control that they are
dealing with a drunk. This could cause the (drunk) patient to become
argumentative and insistent that he is not a drunk.

> Maybe weekly would be a good time to do it?

A fire department about 30 miles away was put on our frequency, apparently the DOC said we're juuuuust far enough away from eachother to not notice. Well, at or about 10h00 every morning [there it goes now!], "Attention all Langdon firefighters, pager test, pager test, time is ten fifty one on 16 march 1994" etc. Every Day Of The Year. [Hey Langdon, Hi from Redwood Meadows! :)] Plus, I'm not sure but I think our chief is trying to get our tower raised, so that'll make a difference too..

On the department I used to work with in Ontario, we shared the frequency with at least 3 other departments regularly, plus two rescue boats. Every night at 17h45 one particular department would have EVERY MOBILE AND EVERY HANDHELD AND EVERY STATION call into the dispatcher to check radios. "____, this is Truck 4, report my signal" "loud & clear 4" "____, this is Station 4, report my signal" "loud & clear station 4" etc. Someone must have said something, for eventually all you heard at 5:45 was "All ____ units switch to frequency two for radio check". :) :) :)

If anyone from southern ontario, esp. east of Toronto, thinks they know what department I'm talking about, let me know.. :)

This week on Spectrum we will talk about receivers. Our guest is a man who knows them from antenna jack to speaker. Larry Van Horn answers technical questions all day long on the Monitoring Times answerline. Larry has the opportunity to test almost everything that comes down the pike and with that unique position he can give a great overview of receivers. Bring your questions to Spectrum this weekend and get them answered from the expert.

Next week on Spectrum (Saturday March 26'th) Spectrum will feature a look back at radio and telecommunications history through the ears and eyes of Don Kimberlin. Don worked in all aspects of radio and tellecomm from the 1950's through today. He has an interesting perspective on the communications industry and is a living archive of high-tech history. The only way anyone can know and interpret the future is to see it after understanding and learning from the past. Don is a high-tech historian and you will see why on Spectrum.
--
Spectrum airs live Sunday at 0300 UTC (2200 EST Saturday) on:

WWCR, 5810 KHz, Nashville, TN (World Wide)
WIFI, 1460 AM, Philadelphia, PA (Philadelphia Area)
KHNC, 1360 AM, Denver, CO (Denver Area)
Omega Radio Network, Galaxy III, X17, 5.8 MHz WIDE audio. (Satellite)

Spectrum is rebroadcast:

Sunday at 1500 EST, on WIFI, 1460 AM, Philadelphia, PA (Philadelphia Area)
Monday at 0400 UTC (2300 EST Sunday),
on WWCR, 7435 KHz, Nashville, TN (World Wide)

ETOH is a funny thing. Its a pain to get new people to use it, because it doesn't seem to make much sense. But, people are right when they say it helps keep the patient calm! NO ONE likes to be called a drunk. I had a patient ask me once who could possibly know that he was drunk, since he knew we were dispatched with radios to his residence. I didn't hhave the heart to tell him that anyone within about 50 miles had a chance! :)

I have received many questions about where the ham radio FTP files are -
World or Oakland?

When I posted the message about the switchover from World to Oakland, I'd
completely forgotten about the automated period reminder about the file
availability on World.

I have modified that periodic reminder, and will have it replace the one
mentioning World. It will, instead, mention Oakland.

Sorry for any confusion or inconvenience this may have caused.

From: dtiller@cscsun.rmc.edu
Message-ID: <CMs0EI.E6q@cscsun.rmc.edu>
Source record: 276363

I just got my full US index CD of 3 million (!) FCC records for the
whole US. I'd like to make it available over the internet, but I'm
having grave doubts about the disk space required for indexes. Does
anyone know the format of an .nsx file with regard to DBASE III databases?
I'd like to use their indexes if at all possible. I've already written
code to interpret the .DBF file (that was easy). Also, anyone know what
regex interface code the folk at tcomeng.com are using? They've got
the same company's CD as mine. Anyone know of a contact there? I don't
want to bother root@tcomeng.com. Any help will be greatly appreciated,
and will help get a nationwide database going!

> I'm assuming there is some sort of constant communication between the
> pilot and someone chasing the balloon.

Think about how far away you can see a balloon, and then decide if you need the pilot to guide you to it. There's probably not as much chatter as you'd imagine.

Search 118-136 is my guess. Depending on the airspace they use, they may be required to talk on the aircraft frequencies. And that's probably where they hang out when they're NOT talking, too, for the information value.

If it's near an airport, listen on one of: approach/ departure, tower, or CTAF (check an A/FD or sectional for these freqs).

1808. BC8500XLT (25-1300) READ!

Newsgroup: rec.radio.scanner
Date: 1994-03-16 23:31:22 UTC
From: cmcl@beach.cis.ufl.edu
Message-ID: <cmcl.17.00178692@beach.cis.ufl.edu>
Source record: 276366

Attention All BC8500XLT Owners (or future owners)!

Don't count this one out yet!

I have successfully got this thing so it is a coninuous receiver from 25 to 1300 MHz. It allows direct keyboard entry of any frequency. If you are doing an AUTO search, the freqs are properly stored in memory locations! (I get excited about this because my first attempt wouldn't allow direct keyboard entry or to save freqs in memories! But never fear, ALL works great now!!!) I have already modified two with no problems at all!

So everyone hang tight, I am trying to get a hold of the scanner guy at Popular Commuications (and others) to see if they want to publish.

1810. New Uniden scanners

Newsgroup: rec.radio.scanner
Date: 1994-03-17 09:36:40 UTC
From: brett_miller@ccm.hf.intel.com
Message-ID: <brett_miller.17.00099CC3@ccm.hf.intel.com>
Source record: 276372

I received the new Grove catalog yesterday. It had two new Uniden hand held scanners in it. I forgot to bring it with me to work, but I can remember that one was a "sports" scanner with preprogrammed sports (??) frequencies. It had 10 special "hot keys" that access your 10 favorite freqs. No numerical keypad.

The other scanner is the replacement for the BC200XLT. It has 100 ch/sec "Turbo Scan" and service-search buttons (like the pro-51). It looks like the freq. range is about the same. I would bet that cellular is non-restorable. :-(

The other interesting thing in the catalog is some new interference filters. They range from $20 to $3x. There are three band ranges specified, although non of them seem all that useful. From memory, passbands were 30-1200 pass band, 118-137 notch, 517-1700 low pass (passes freq below 517) I'd sure like to see one that kills 88 - 108 (FM BCB) These come with a variety of connectors, including 'N'

I have done the mods to my PRO-43 and they wolrk well. Remember that modifying your scanner will void the warrantee. The mod itself is not very difficult, but I am an electronic by trade. I would not reccomend making the mod if you have no experence with a soldering iron or surface mount components. The boards inside are multi-layer and can be damaged if too much heat is applied. If you decide to try anyway, then gook luck.

Happy Scanning

From: jss@ruffin.larc.nasa.gov
Message-ID: <2m9ivt$ad8@reznor.larc.nasa.gov>
Source record: 276368

Jim; In your article you said

I'm hearing a succession of what sound like short data bursts
on this frequency. The transmitter is keyed for each burst;
the bursts come about every 1.5 sec for about 5 bursts, then
there's an occasional pause.

I wrapped my MVT-7100 in aluminum foil and drove around at
lunchtime, and was able to localize the source to within a
1/2-mile square, but the signal eventually "pinned" the S
meter, even with the attenuator switched on and no antenna
attached. A 50-ohm termination connected to the antenna port
was of no use; the radio isn't shielded well enough to make
a difference. (Where have we heard that lately?)

The 1994 Connecticut Scanner Guide doesn't list anything even
close to 469.9875 MHz.

The source appears to be in West Hartford, Connecticut, near
the town dog pound, etc, an industrial area. Too many antennas
to even guess which one is the source.

Learned opinions requested!

I believe that what you are hearing is digital pager data signals if you keep listening you might hear a voice page or two, but generally they are not very interesting.

Happy Scanning

Yes. I don't recall the exact number, but if you want to pick up signal with vertical polarization (transmitted from a vertical antenna - like most VHF/UHF), you will loose something like 8 to 15 dB if you use a horizontally polarized antenna (and vise-versa). Remember 3dB is half power! Most signals are strong enough that it doesn't make that much difference, but if you want to pick up weak signals, you should use an antenna that is polarized (i.e.mounted) the same as the transmitting antenna.

I have heard that with an adapter, you can mount a CB mobile antenna to the top of their discone.

> ETOH is the medical abrev for alochel
> like DOA, DOS, EOA, ect goes back to the latin and greek
> ETOHAL

x93richards5@wmich.edu's explanation isn't quite right, either. The alcohol found in beverages is grain alcohol or ethanol. It's chemical structure is

CH -- CH -- OH
3 2

Where "C" denotes carbon, "H" denotes hyrogen, and "O" denotes oxygen. The CH -- CH group is called an "ethyl group", and for brevity, organic chemists
3 2
have a habit of abbreviating it with the symbol "Et." The big formula above can be condensed to Et-OH. That's probably where the abbreviation in question comes from.
There may be a valid reason for wanting to use something other than "alcohol" in the context of intoxication. There are other alcohols out there, too. Common examples include isopropyl alcohol (rubbing alcohol) and methanol (wood alcohol or Me-OH), and both have been the objects of consumption before. Methanol is a serious concern because it can cause blindness in small doses and death in larger doses, so you can see why paramedics might want to differentiate between alcohols.
My question is why they don't use the APCO brevity code 10-56 for someone who is intoxicated like the police do. Hmm...

Pro-43 Memory Expansion.

I too have been very interested in the possibility of expanding my pro-43's memory capacity. Figuring that I've all ready spent too much on this silly toy, I don't really want to buy Cheek's book (Which *I'm* sure is an excellent book, but I imagine it contains all kinds of information which will not be related to the 43.) So instead, I've been studying the schematic for the 43. Besides, the EE in me would rather solve the problem for himself. :)

It appears to me that adding memory might not be that difficult. (If you don't have a schematic then what follows might not make much sense. What I'm hoping for is someone out there who is familiar with the 43's guts and/or the 'Creek mod' to comment on my idea.)

IC's 2&3 are identified as part# AK93C67F, and are shown to be a 4K (256x16bit) serial EEPROMs. [Here is the first problem. To date I've not been able to find any 93c67s. I have found 93c66, which seem to have the same description as 93c67, but I don't know for sure. Tandy might very well be able to source these, I haven't tried.]
Electrical speaking, these 2 EEPROMs are piggy-backed on top of each other, pin-for-pin with the exception of their respective Chip-Select (CS) lines. The CS lines go to two different pins on IC1, the CPU-controller IC. It appears to me that it should be possible to physically

piggy-back two more 93c67s on top of the existing ones, connecting all
the pins together except for the CS lines. Next one would have to insert
a DP-DT switch into the circuit that would switch the CS lines from
one pair of 93c67 to the other. This should allow me to have
2 banks of 200 channels. The insertion of a switch, usable when it
all put back together, might be the most challenging part of this!

When studying the schematics one notices that there 3 unused/unconnected
pins on IC1. These 3 pins are 3 bits of the SAME port that is controlling
the memory. That makes me wonder out-loud if it is possible the CPU
is already setup for 400 channels, and perhaps two of these unused lines
might be intended as CS for more memory. That of course is wild
speculation.

Those are the rambling thoughts of one EE, anybody have any thoughts/ideas?
In any case, it would not be a job for the casually interested, whos
idea of a soldering iron is a Weller 100W soldering gun, and talk about
voiding a warranty!

BB
E-Mail Welcomed.

1817. Adding low frequency element to RS discone

Newsgroup: rec.radio.scanner
Date: 1994-03-17 18:24:43 UTC
From: scott@redstorm.nawc-ad-indy.navy.mil
Message-ID: <9403171824.AA13040@cs.utexas.edu>
Source record: 276374
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I just had an idea that I'd like some feedback on. I own a RS discone which
does not have the vertical element to help in the low frequency range.
I have seen ads in MT for a 46 MHz full wave or half wave dipole wire and
thought that I could string my own wire from the bolt on the top of the discone
where the vertical element would be attached.

Are there any major disadvantages to stringing this element horizontally
along and above the roof of my house rather than having a vertical element?

It seems to me that this would help a lot in providing better reception for
my state police frequencies (~42Mhz) and cordless (not that I listen :))
frequencies.

If this were possible, what would be the best type of wire to use?

Any input would be greatly appreciated. Thanks in advance.

>tried.]

WSR 2/94 page 3

"The serial EPROM chips should be DigiKey's 93C66/SN-ND or equivalents.
Part # for the 4066 chip is CD-4066BEND, but you could also use a 74HC4066

or just about any other version of a CMOS bilateral switch, perhaps even a non-inverting buffer!" Also suggested are two 100K resistors on either side of the SPDT switch to pull the control pins on the 4066 to ground.

>Electrical speaking, these 2 EEPROMs are piggy-backed on top of each
>other, pin-for-pin with the exception of their respective Chip-Select
>(CS) lines. The CS lines go to two different pins on IC1, the CPU-
>controller IC. It appears to me that it should be possible to physically

>all put back together, might be the most challenging part of this!

Sound like Bill Cheek's scheme also as far as the pigggy back description.

WSR has about 1/3 page for a simple schematic of the above hookup.

I waiting for some EEE to get it right before I try it!

>(i.e.mounted) the same as the transmitting antenna.

I took one of the top elements down to the hardware store and found some copper tubing that the element fit snug into. Then, I bought 10 feet of it and took it home, cut it in half and slipped the two five foot sections onto the discone....horizontally. It worked great and there was a big improvement on the low bands. The upper bands were unaffected. The only problem I had was that copper is flexible and if you go with more than four or five feet, it will droop and sag a bit. Anyway, this was an easy and cheap way for me. I suppose the verticle element would be the best way to go though.

>---
> • SLMR 2.1a • "Got arrested for going 14400 in a 2400 Zone.

I would also like such information. I don't have any real experience with scanners but from what I read I think I know the basic features I would need. First of all, I would want good frequency coverage (no gaps), good frequency steps, especially small enough steps. Cellular and portable phone coverage definitely. btw, I will probably end up buying used because I think the scanners need to be modified for cellular and for the gapless coverage. I'm not great with a sodering iron, and I'd probably kill my scanner if I ever tried to modify it myself. So, for a scanner with the above features, and good clarity and range, which models would be best, and how much should I expect to pay? (used probably)
thanks

Chris

1823. where to buy crystals?

Newsgroup: rec.radio.scanner
Date: 1994-03-17 22:20:26 UTC
From: billp@voyager.chm.clarkson.edu
Message-ID: <1994Mar17.222026.11479@news.clarkson.edu>
Source record: 276281

I have an old-fashioned, Regency, 8-channel crystal scanner that's been sitting around collecting dust for a number of years now. I'm thinking of putting it back into service (don't laugh). It's not a bad receiver; seems noticably more sensitive than the Realistic handeld that I have. Anyway, I'd like to set it up as a wx receiver to monitor NOAA and continuous Coast Guard marine advisories that are broadcast in my area, if I can buy a dozen or so new crystals for somewhat less than the $5+ they cost (last time I bought one) at the local Radio Shack. I don't feel it's worth spending almost as much on crystals as they (RS) are asking for the close-out model (pro-whatever at $79) programmable handheld, but for $2 or so each, I'd consider giving this old radio a new use.

Anyone know of a good source? The last Digi-Key catalog I got had quartz crystals for as little as 1.79, but these were probably intended for microprocessors and other clock applications; they didn't list the selection necessary for scanner use.

thanks for any help...

-billp

I have the Rat Shack Discone and have added an old CB base mounted coil whip to the center and it helped pull in state police 42Mhz freq's from 40 miles away that I never got before. You may also add an FM mast to the center to help too. Either way it helps and isn't that hard to do.

First of all...does anyone else own one??

Secondly, does anyone know about any mods? Not that I'm going to use them right away, it would just be interesting to see if any one else has this nice (for me, anyway, first one I've ever had) scanner.

Thanks in advance...

Use thin wall aluminum tubing. It weighs much less than copper, and will
stay up there even in strong wind gusts if you fasten it properly.

Rest easy. What he means is that it can be modified to receive any frequency
from 25 - 1300 MHz (I'd like to hear more about this!). The fact that it is
done through the keyboard is not the point. Any scanner with a keypad can
direct enter any frequency that the scanner can receive. The point of his
post is the receive range, not the keyboard entry.

^^^^^^^^^^^^^^^^^^^^^^

I just wanted to make a comment on WWW here. I've been using Internet stuff for about 4 years, but last week a guy gave me a program called Mosaic that is a software interface to World Wide Web. All I can say is: WOW!! WWW allows a point and click interface to the Internet. Instead of cryptic unix commands you can see everything and click the mouse on what you want. You can click on a line and have a high resolution movie play on your computer with sound! You can navigate FTP like Program Manger in Windows. I clicked on a few lines and was reading the Dead Sea Scrolls which had pictures of the original manuscripts. It is amazing! All I'm saying here is that if you can get WWW access, get it. It is a full multimedia superhighway - who needs Al Gore!

Now we return to your regularly scheduled scanner discussions...

I have purchased from JAN before, but the issue here is price. Xtals are
expensive. As far as I know, ordering xtals from Radio Shack at $5.xx, is
about the cheapest you can buy them. The only cheaper way I can think of is
going to swap-meets. I have an old RS patrolman 77A VHF, and an old
Unimetrics UHF xtal scanner that still perform quite well, but I can't bring
myself to buy a full set of xtals for them (especially since I just moved).
I do have some San Jose, CA xtals that I'd be willing to sell if anyone is
interested.

This is a periodic reminder that the Boston Amateur Radio Club maintains an
FTP area on oak.oakland.edu (141.210.10.117) in /pub/hamradio.

Oakland is available via the following methods:

On most systems, the command needed is: ftp oak.oakland.edu
or: ftp 141.210.10.117
For Gopher: gopher gopher.oakland.edu 70
World Wide Web URL: http://www.acs.oakland.edu

Please feel free to browse through the area.

If anyone has any questions about it, please do not hesitate to e-mail
either of the co-moderators listed below.

Also, up-to-date copies of the files on the ARRL's information server
(info@arrl.org) are available in the directory /pub/hamradio/ARRL/Server-files

Source code for programs is always welcome. It can permit people to use
those programs on other computers with other operating systems.

I have a Regency R-700 which dates back to 1970 or so... Anyway, you can
buy crystals for scanners custom made Crystek (2351 crystal drive, Ft. Myers,
Florida 33907, catalog, 800-237-3061 8:00 am to 5:00 pm, free in US, except
Florida, Alsaska, and Hawaii). They make anything from 800Khz to 250Mhz, ect
(including scanner crystals, military and satellite, VCO's, Oscillators, also
TCXO and commerical two-way repleacements, Surface mount clock oscillators for
TTL and CMOS, O.C.C.O. Oscillators, Microprocessor crystals 1 to 100 Mhz, and
Crystal holders in ANY case type and harmonic. I don't have any information
on prices from Crystek.

Another company JAN Crystals is also in Florida, I don't have the address
handy at the moment.

Ah-so. He is using a 4066 to do the switching. Sheww. must be a tight
fit. Then he only has to bring control lines for the 4066 outboard.
After posting my thoughts on this, I remembered to consider the possible
(likely?) needs for pull-ups/down on the unused 93c66 chip select pins.
Something else to consider.

>>Electrical speaking, these 2 EEPROMs are piggy-backed on top of each
>>other, pin-for-pin with the exception of their respective Chip-Select
>>(CS) lines. The CS lines go to two different pins on IC1, the CPU-
>>controller IC. It appears to me that it should be possible to physically
>>piggy-back two more 93c67s on top of the existing ones, connecting all
>>the pins together except for the CS lines. Next one would have to insert
>>a DP-DT switch into the circuit that would switch the CS lines from
>>one pair of 93c67 to the other. This should allow me to have
>>2 banks of 200 channels. The insertion of a switch, usable when it
>>all put back together, might be the most challenging part of this!

Me too! I'm just an EE, and someone with EEE is sure to be better. :)

I'm going to sit back down, and start drawing up some possible solutions.
I'm wondering if a 14053 analog mux/demux might also work.
I'll post what ever I come up with. In the mean time, I think I'll order
some eeprom!

>issue for the paramedics. Why not just say alcohol?
>

ETOH stands for Ethanol in chemistry, so they really are saying alcohol.
However, if you say alcohol, it could be isopropyl or something
else around the house. Te level of the call would change to a more serious
one, because now it would be a poisoning, not an intoxication...

Hello all,

I would like to know how to keep a BC200XLT going after the
rechargeable battery packs are used up. I have never seen any
other sources for powering these other than the included batteries.
I will be going on a long-distance train trip without a way to
recharge the batteries.

Does someone have a digital (e-mail sharable) file showing
the conversion table between frequency and channel for the
Aeronautical bands? In particular I am interested in
the navigation aspects (VOR,VORTAC).

Thanks.

Try rec.radio.amateur.misc. There may be some "Super Geeks" there that are up on pager technology. Personally I hate them because the use enough power to fry an egg from 100 ft. My sensitive scanners don't like that.

Get the lighter plug adaptor and just leave it plugged in (the the battery pack) when you are using it. You can even make one yourself. The pack takes straight 12v and it has an internal regulator, so you don't have to worry about that. You could buy the parts from Radio Scrap. - just get the polarity right.

1840. Pro 39 Mod & Question

Newsgroup: rec.radio.scanner
Date: 1994-03-18 17:05:49 UTC
From: jqtaylor@boi.hp.com
Message-ID: <CMvE5p.79p@boi.hp.com>
Source record: 276292

Okay, I'm posting the Pro 39 mod and a Pro 39 - Pro 43 comparison I did last year, because I need help with my Pro 39. It seems that when I press the SCAN button, it does not start scanning. It does not beep either, so I am thinking that the switch is dirty. I wonder if the SCAN button is worn out - entirely possible, since I've had it over a year and that's the button I like to press! So how can it be fixed? After it's been on a while, if I press it enough times, it does work - occasionally.

Here's the old articles:

*** Bob's Tip of the Month ***

(from Monitoring Times, January 1993, Dial 1-800-438-8155, Great Magazine!)

Realistic (R) PRO-39 Cellular Restoration (Page 107)

[with a few comments added by someone who witnessed such restoration -jqt]

The recently released PRO-39 handheld scanner from Realistic (R) is a fine performer, but its 800 MHz range is interrupted by the factory censoring of cellular frequency coverage. Long-time MT supporter Larry Wiland of Youngstown, Ohio, would like to share the simple fix. Remember, however, that it is unlawful to listen to cellular phone calls.

(NOTE: These procedures may void your warranty. Do not attempt them unless you are familiar with small component soldering. Monitoring Times accepts no responsibility for damages resulting from attempting this modification.)

TOOLS NEEDED: Fine-tipped soldering iron, desoldering wick, small Philips screwdriver, long-nosed pliers, rosin-core solder.

(1) [Turn off your radio. Removing the batteries when the radio is ON can erase the memory! -jqt] Remove the battery door, holder and [battery pack] from the bottom of the radio.

(2) Remove the four screws from the back of the scanner and carefully lift the back off.

(3) Unplug the two wiring harnesses at their connectors and remove the six bright colored screws [that hold] the circuit board in place. Unsolder the ground wire from the lower right corner of the circuit board. Unsolder the two wire connections from the BNC antenna connector at the

board. Carefully lift the board (grasping it near the Molex connector)
and set it aside.

(4) Remove the two bright colored screws from the next circuit board.
Carefully unplug the two-wire connector [and remove the board, as I
recall -jqt]. Unsolder and lift the rectangular metal shield exposing
the diodes.

(5) Carefully unsolder and remove diode D6 only; this will restore the
missing cellular frequencies which can be searched in appropriate
30 kHz steps.

This completes the cellular restoration. Reverse all procedures
to reassemble the radio and test it by entering any frequency between
869-894 MHz. [If you are as lucky as I was, the memory will still
contain your other frequencies! -jqt]

Curious about the other diodes? D4 would enable 68-88 MHz
coverage, but deletes 30-54 MHz; D5 (present) allows 800 MHz band
operation; and D7 would make cellular spacing 12.5 kHz (incorrect).

Thanks Larry!

A TALE OF TWO SCANNERS

~~~~~~
The Pro 39 and the Pro 43: A General Comparison
by John Quill Taylor

~~~~~~

This is a general yet practical comparison between two popular Realistic(TM)
Brand portable scanners, the Pro 39 and the Pro 43. This is not an in-depth
technical comparison, as these have been written already. This is a
comparison from my own experience using both scanners. I've had a Pro 39
for seven months, and a Pro 43 was just acquired recently, so my report is
probably biased toward the Pro 39, with which I am more familiar.

Overall Impressions and complaints:
==================================

The Pro 39 & Pro 43 have some major differences and some subtle differences.
The subtle differences can be surprising. For example, the beep
confirmation tone is about one whole note higher in frequency on the Pro 39
than on the Pro 43! Also, each radio has its own "personal" behavior: the
quality (or lack thereof) of its sound, the brightness (darkness?) of the
internal lamp, and the ease with which you can read (or not read) the LCD
display, all vary between one radio and another, even of the same model!

In MANUAL mode, both radios have a STANDBY feature that allows the scanner
to consume less power, Both radios go into STANDBY mode after about 5
seconds. The STANDBY circuit produces and audible thump in an external

speaker. When using an AC adapter (either charging or powering), an audible hum is heard when using an external speaker.

What's GOOD about BOTH the Pro 39 & the Pro 43:
==========

Both of these radios share the same small footprint (more like thumbprint!). They use the same battery pack (6 AAs), AC and DC adapters (9V), and have a similar look and feel, including the antenna connector (BNC), earphone connector (1/8"), and squelch and volume knobs. Both radios can be modified to restore full 800 MHz coverage, and modifications exist to eliminate the beep and improve the sound.

What's BAD about BOTH the Pro 39 & the Pro 43:
==========

Although a modification exists to defeat the beep confirmation tone, a switch to enable or disable it would have been nice. The sound of the beep when using headphones or an external speaker is quite obnoxious, but the beep is somewhat useful during programming, since the buttons are rather small.

The belt clip is a piece of trash. Granted, it only costs a dollar to replace (at Radio Shack); I've spent three dollars more than I care to have spent on this weakly designed part. Luckily, its failures have not caused any damage to the radio itself, a very real possibility.

The internal speaker's in both radios suck.

On my Pro 39, I once was removing the batteries while the power was on, and I lost all the frequencies! I am unsure whether this can happen to the Pro 43, but I recommend turning the power off before taking the battery pack out and leaving it off until the pack is securely in place.

When in PRIORITY mode, the scanners often "leap" from a frequency with a solid carrier. Also, during the "sampling" of the priority channel, the radio often "misses" a pressed button, requiring you to press it again. These little "bugs" occur also on the Pro 2006.

What's GOOD about the Pro 39:
==========

The Pro 39 has a lower price.

The Pro 39 has a much easier to read LCD, at least on the radios I have seen. I returned my first Pro 43 because the display was hardly readable.

The Pro 39 uses less than half the current drain as compared to the Pro 43 (according to published specifications). This was my initial reason for getting a Pro 39 versus a Pro 43. Where does all that power go in the Pro 43? Is it the triple conversion? Is it the triple conversion? Is it the triple conversion? Who knows?

While the internal speakers are awful in both models, my Pro 39 has a much better sound. It is, in a quiet room, even "listenable." The Pro 43 speaker "cracks up" (this may be the fault of the audio amplifier, since both radios perform well with headphones or an external speaker).

The general "behavior" of the Pro 39 seems a bit more "positive" to me, although I have owned this radio much longer than my Pro 43. When scanning, pressing LOCKOUT works immediately on the Pro 39, while it seems to hesitate a brief moment on my Pro 43.

What's GOOD about the Pro 43:
==========

The Pro 43 has a few extra front panel features that are nice, like an AM/FM button. The Pro 39 "assumes" AM mode in certain frequency ranges, and this mode cannot be "overridden" with a button like the Pro 43.

The Pro 43 scans in both directions, from lower to higher channels (default "wakeup" mode, like the Pro 39) and also from higher to lower channels. This is a subtle but very handy feature that allows you simple way to "bounce" back and forth between two closely spaced "hot" frequencies.

The Pro 43 features triple conversion (versus double on the pro 39). I didn't think this was a big deal, especially if you live in a "little" town like I do, and I still don't think it's a big deal if all you do is scan the programmed channels. Where triple conversion pays off is during searches, but since neither radio has "frequency lockouts" during search mode, both radios will "hang" on dead carriers, birdies, etc. during searches.

The Pro 43 has a shorter antenna (about 1/2" shorter). It is also narrower (about 1/8" narrower).

The Pro 43 "remembers" the channels without batteries, although many times I have left my Pro 39 on all night (after the batteries expired) and the frequencies were still there. Maybe I am just lucky.

The Pro 43 has better frequency coverage (see the Radio Shack Catalog).

The Verdict:
==========

The Pro 39 is less expensive but it only uses double conversion. The Pro 43 uses triple conversion, and yet it uses more power, has a more difficult to read LCD, and sounds worse using the internal speaker. While some great discounts can be had on both of these radios, I strongly recommend holding and operating both radios side by side before buying, and, if I had to do it again, I would buy them in person, since it appears that each radio varies in its LCD display and sound quality.

Oops! Did you say TRAIN? I haven't seen too many trains with lighter plugs...

This might sound crazy, but you could get a 12v 6 or 7 Amp/Hr GellCell (sealed lead acid battery) and use this to provide the power to plug into your pack. Its not a great idea to do this a lot, since charging a NiCad with pure DC is not too great for them (wall warts have slight AC ripple), but doing this a few times will have no significant effect on the life of the battery.

If you want to spend some more money you could buy Metro West's super long life pack for the 200xlt about $65 from Metro or Grove. It is 1200 mA/hr, which is probably twice life of the regular pack.

>
> Does anyone out there listen to hot air balloon pilots ?
> I'm looking for any frequencies you may have heard them on.
> There are a lot of hot air balloons in the Ottawa ,Ontario area.

Hmmm, good question. You might try the "multicom" freq, intended for communication between aircraft in flight (somewhere around 123.0 or 123.5 in the aircraft band - someone can verify), or elsewhere in the aircraft com. band (118-136 MHz AM phone), since multicom would get awfully crowded if everyone used it at the same time. I'll bet however, that for their purposes, balloonists are just as likely to be using walkie-talkies in the CB or maybe low-power public use bands, or even ham equipment, if licensed.

Maybe you ought to post your question to rec.avaiation, someone there should know.

-billp

What!!! EEPROMS have a limited number of writes (like 10000 or so).
Why doesn't the manual mention this? Does this mean every time I
lock out a channel, and then later unlock it I've used up 2 writes?
I make heavy use of the l/o key, if the manual had mentioned this
I wouldn't use it so much.

Does anyone know the details?

1847. RS Cell-Like Mobile Antenna

Newsgroup: rec.radio.scanner
Date: 1994-03-18 19:44:04 UTC
From: etoler@csn.org
Message-ID: <CMvLHH.AvJ@csn.org>
Source record: 276299

Radio Shack Scanner Antenna, Cellular look-alike:

I would like to use the RS Cell-like antenna on my vehicle. I have heard that the performance is acceptable and especially like the subtle quality of an antenna that most, hopefully even the *authorities*, would mistake for a cell phone.

My specific question is regarding the thru-glass coupling. I understand that window tint film must be removed AND the glass can have no factory metallic tinting. My vehicle is a '93 Nissan Pathfinder and the best location for the antenna is the very rear side window. This window has a factory bronze tinting throughout the whole glass and looks a bit reflective. Do any of you vehicle/antenna/cell installation experts know if this window has a metallic coating in it, thus rendering it useless?? The only other option, due to vehicle layout, roof racks, etc. is the front windshield, not the best option.

If any out there know either the answer, or a test I could do (short of actually mounting it) e-mail me or post it. Thanks in advance and happy listening.

Eric Toler

1849. WANTED: DFW Scanner frequencies

Newsgroup: rec.radio.scanner
Date: 1994-03-18 21:06:04 UTC
From: rgregory@adr14
Message-ID: <CMvpA4.Bvy@skopen.dseg.ti.com>
Source record: 276301
Cross-posted to: rec.radio.scanner,dfw.forsale

Note: this is cross-posted to both rec.radio.scanner and dfw.forsale.
Please follow-up via e-mail to me.

I am looking for a list of DFW scanner frequencies. I know I can
go to a local Radio Shack and get the Police Call book, but I want
a more complete list. For instance, I would like to be able to
listen to TI security and other local stuff.

The last time I posted this request, a really nice guy called me and
told me about a BBS called Smoked Armadillo's. I called it and still
couldn't find a list. I found a couple of references for a Code 3
BBS and a Midnight Angel Express BBS (or something like that). I did
find a small list of some Addison frequencies, but I live in the
Garland/Rowlett area and would like those frequencies, primarily.

One person on a BBS mentioined a 200+ page book of DFW frequencies
that I could get at an un-named bookstore on the west side of Fort
Worth for $30. Does anyone know where in the Dallas/Garland area I
can get this book? I really don't want to spend an entire day driving
to FW for a frequency book (and spending $30 on it, to boot).

Any help would be greatly appreciated. If I get a good list, I will
post it to rec.radio.scanner, unless that's where I find it. :)

I realize that this probably doesn't meet the charter of this newsgroup, but I figured that given the high density of radio geeks here, that this might be a good place to post.

Being a geek myself, I like pagers. I need to do a short paper for a Communications Engineering class that I'm taking, and I'd like to do one on the technical challenges that had to be overcome for the paging systems in use and how they work. I'm concerned, however, that all of this kind of info is proprietary and never leaves Motorola :-). I'm an image processing person, so I keep up with the pattern recognition, image processing, etc. journals, but have never read and communication systems journals.

In any case, if anyone can point me toward technical info (or tell me that I'm barking up a proprietary tree that I can't climb), I'd appreciate it.

Thanks,
Neil

p.s. -- If someone could suggest a better newsgroup, that's welcome, too.

Hi Guys,

Anyone know where I can find mods for the PRO-35?

I've already checked oak.oakland.edu with no luck.

Thanks,

Tony

Outstanding idea! (Oh for the Net!)

I have on order some eeproms and 4053 to do the switching.
I should get them next week. I keep everyone posted as to how it goes.

Misinformation alert! There is nothing wrong with pure DC for
charging Ni-Cads.

The GellCell idea is a good one. One of the advantages of the
Pro-43 is that is uses regular AA Ni-Cads. No rip-off prices
for battery packs. (Most battery packs contain AA Ni-Cads anyway,
at 2-3 times the price.)

: glass diodes. Cut the lower one to restore cell, cut the top one to speed
: up to 30cps from 26cps. Turn the scanner on and program in 870-890 on one
: of the search banks. Hit reset and the 30Khz mode should light up on the
: display. Hit the arrow key and your searching.
: The Pro-43 is pretty easy to modify too. It will take a little longer
: because the whole radio needs to be dis-assembled but it really is easy.
: You can get better prices for either from Grove Enterprises (800)438-8155
: or Marymac (800)231-3680.....
: Les

As long as you are in there you might as well clip the upper diode (D503) and get a 4-6 channel/sec speedup in scan mode. It doesn't speed up search mode though. This won't affect any future mods you might want to do unlike adding a faster clock crystal will. It also doesn't affect the delay time. I found the slight speedup was just about all I need since I scan a lot of fairly active channels.

>Misinformation alert! There is nothing wrong with pure DC for
>charging Ni-Cads.

It depends on what you mean by WRONG. True, there is nothing WRONG with pure DC, but it isn't the BEST way to charge nicads. A slight AC ripple helps to remove dendrites that can form on the plates and kill your cells (dendrites grow on the plates and eventually short out the cell, this is why people do battery "zapping"). A slight AC component is used in many commercial chargers because it helps remove gas bubbles that can form on the plates of wet or gel electrolyte cells (also known as "burping"). The electroplating process uses this method using offset AC to get a smooth hard plating.

Maybe I overstated the pure DC charging problem in my first post. There is nothing wrong with pure DC, but it isn't the BEST way to keep your Nicads in top shape.

Also, most battery packs are not AA. These are rarely used because you can get 3/4 AA that have the same performance and take up less space. Most Ham radios use little cells about an inch high and 3/4 of an inch wide. They sit sideways in the pack, not vetical like a AA would. I can't remeber their name.

Scanner crystals cost $5 back 20 years ago, and they haven't
increased much in price since. That's pretty remarkable.

The only way you will get new scanner crystals for under $5 each
is though private deals. I bought 1,000 scanner crystals from
the estate of a person who owned a scanner sales & service shop.
I also buy scanner crystals in bulk at hamfests. (I don't often resell
crystals. I buy them for my own scanner collection.)

You must know what you're doing as crystals for Regency, Sonar,
and Bearcat are different and not directly interchangeable.

Expect to get some defective crystals, even if new.
I bought new crystals at Radio Shack a few months ago and one out of
three was bad. They were ordered through the local store and arrived
in one week.

Another scanner crystal source is:

Of course you could just lug along a 12-volt car battery if they don't
have a lighter plug handy... Those big car batteries oughta have enough
juice in 'em to keep you scanning for a LONG time...

Kevin...

I'm new to this internet stuff so hope this message makes it to the news group.

The Freqs. you're looking for are between 108 and 116 Mhz. As a pilot I've never had to use the actual "channel" number. The Freqs. for the VOR or VORTAC station that is desired for navigation is simply dialed in (in Mhz) on the Nav radio in the airplane. Many scanners do not receive this portion of the aircraft band. I guess the manufacurers figure that there's nothing there to listen to. Weather conditions at the VOR/VORTAC site or nearest airport as wellas regional aircraft oriented weather forecasts and reports can often be heard.
Likewise, all voice traffic in the aircraft band (ATC) uses com freqencies in Mhz.

Hope this was of some help.

J. L. Gregg

1869. Another wideband scanner

Newsgroup: rec.radio.scanner
Date: 1994-03-19 21:20:55 UTC
From: schuster@panix.com
Message-ID: <2mfqbn$kqi@panix2.panix.com>
Source record: 276191

Jeff Goldman just sent me a spec sheet (in Japanese) for a new scanner from Nissei Electronics, manufacturer of the AOR AR1000. It's variously known as the Camnis HSC-050 or Trident TR-2400. The latter is apparently available from ACE Communications as we speak.

The Camnis appears to be a complete re-working of the AR1000, unlike the AR1500 which merely added a few features to a widely-criticized hardware/software design.

Basic specs: Covers 100 KHz - 2060 MHz continuous in channel steps from 1 to 999 KHz. AM/nFM/wFM/SSB modes; the latter uses an analog BFO like the AR1500 (sigh) so you can't store or scan SSB frequencies. 1000 memory channels, delay programmable between 1-12 seconds. All-or-none attenuator switch. Uses 4 AA cells like the AR1000. Scans at 20 channels/sec (which is what the AR1000 actually does, "rated speed" notwithstanding). Same basic footprint and appearance as the AR1000, including the blasted "Frankenstein knobs" on the sides.

The firmware has been re-written according to Jeff, and it is a lot simpler to program than previous AOR models. He should have one on Monday, so I can probably post how it compares to the Yupiteru MVT-7100.

NOTE: This is =NOT= the new AOR handheld (AR-8000) we've been hearing about. That radio is delayed for months, due to supply problems of a vital chip.

I've got a REACT DFW listing, I tried to e-mail it, but your e-mail address bounces mail. It also didn't make it to dfw.forsale.

Its created by REACT. The version I have is from 1989, but still much better than Radio Shack book. Here is an excerpt from the listing.

"Requests for either version should be sent to Howell Consulting, c/o Dallas County REACT, Box 223955, Dallas 75222. Request for the Public version should include a self addressed stamped envelope capable of mailing a 8 1/2 X 11 computer printout. "

Here are the DFW BBS's that are supposed to carry it.

I see no need to lighten up. Since I was talking about our network and not slighting any others. Since I'm in the Mich net it's the only one I know any details of.

The point was to let it be known to other Michiganders and to possibly spur posts about other nets across the country. I see no need to attack my post or any others here for that fact, since it's a scanner forum and the pagers are related to the hobby. Sorry you missed the point and were offended.
Thanks, Les

I was just wondering if anyone out there is in St. Louis. I'm looking into possibly setting up a database for local frequencies in the city and county. However, if anyone already has one (or just a standard text file) with any of these frequencies I'd like to know about it.
If you have anything, send it my way if you could. I'd really appreciate it! thanks...

1880. Pro-43 D4 diode!

Newsgroup: rec.radio.scanner
Date: 1994-03-20 03:08:01 UTC
From: surprenc@JSP.UMontreal.CA
Message-ID: <CMy0pF.rz@cc.umontreal.ca>
Source record: 276180

Hi,

Anyone know what is the part number of this diode, or whatever info I need
to buy one?

This is the surface mount diode one have to take off to restore cell freq.
on the pro-43.

Is there a list of all the mods availables for the pro-43?

Thanks,

1881. Re: WANTED: DFW Scanner frequencies

Newsgroup: rec.radio.scanner
Date: 1994-03-20 03:23:08 UTC
From: copeland@metronet.com
Message-ID: <CMy1EL.B3@metronet.com>
Source record: 276181

I looked into the phone numbers I previously posted while looking for the new REACT freq listing for DFW. They are all outdated.

There isn't even a newer REACT list since 1989. But the 1989 list can be gotten from DATALINK at 1-214-394-7438. Its called DFWFREQ.TXT

Its still better than the new Radio Shack catalog that covers DFW.

I have a friend going to England, and I was going to have him look at the Yuperton 7100. However, I've lost the address for Javiton (sp?), and would greatly appreciate it if someone on the net could post their address and phone (if you've got it).

Also, I saw mention of a MVT-7100D. What is the "D" model, and how does it differ?

I've been seeing a lot of posts about an "april cutoff". Does this mean
that after april the PRO-2006 won't be the same? Will the diodes still
be able to removed easily? Also, does this april cutoff apply in Canada,
and what day of april does this go into effect. I don't have the cash
to buy this scanner yet, so I want to know how drastically I'll have to
budget myself! :-)

The proprietor, Jonathan Clough, can be reached by email at
clough@javiaton.demon.co.uk or 100117.535@CompuServe.COM

The "MVT-7100D" is a name given by Bogerfunk, in Germany, for their
modified MVT-7100. They add a (supposedly) 2.3 KHz filter for AM mode,
designed for shortwave use, that you switch in using the keylock switch.

1885. ICOM R-7100 Receiver For Sale

Newsgroup: rec.radio.scanner
Date: 1994-03-20 14:58:50 UTC
From: andre@blade.enet.dec.com
Message-ID: <2mhoba$90h@jac.zko.dec.com>
Source record: 276203

ICOM R-7100 all-mode wideband receiver For Sale
==========

Features:

. 25 to 2000 Mhz continuous coverage! Allows you to receive VHF, UHF, amateur, marine, CB, utility bands, FM and TV broadcasts and lots more.

. All-mode capability: AM, FM, NFM, WFM, USB, LSB

. 900 memory channels in 9 banks.

. Any channel to be assigned to any one of ten "classes". Channels can be scanned by channel across all banks or within a selected bank.

. Channels can be scanned by mode (AM, FM, NFM, WFM, USB, LSB).

. Two "windows" allow a different type of scan in each window.

. 20 Scan edge memory channels (10 low/high pairs).

. Dual scan with over 40 combinations.

. Exceptional sensitivity and reliable frequency stability.

. 0.1, 1, 5, 10, 12.5, 20, 25, 100 Khz and 1 Mhz tuning steps availible.

. Effective 20 dB attenuator for strong signals.

. Built-in 24 hour system clock with 5 ON/OFF timers.

. Automatic recording; important programs can be caught away from receiver.

. Dial lock function.

. Noise and S-meter squelches.

. CI-V system for computer control through optional CT-17.

. Frequency announcement in English with optional UT-36.

. Large function display with selectable LCD backlighting brightness.

. Easy-to-read S-meter plus FM center indicators.

. AC and DC power operation.

I no longer have the time to use this unit (can you say "kids"? %^) and it essentially sits idle 98% of the time.

This unit is two years old and in brand-new condition; it never left the house. The current discount mail-order price for this unit is $1250. I'm selling mine for $999 firm.

This receiver is located in New Hampshire. Buyer pays for non-local sales. Interested or have questions? Contact me at:

So I'm in Radio Shack getting a PRO-43 and I mention to the salesman that I was please to learn that, when the unit was modified, low FM was restored along with everything else. His reaction was on the order of, "Neat. That's nice to know." Either he wasn't aware that was the case or he was following the salesman's first axiom of making the customer feel as pleased about a purchase as possible.

One of the other salesmen at the counter looks real nervous, turns to my salesman and says something on the order of, "Hey! Remember, we can't talk about that" to which my salesman and I reply that we're only talking about low FM. This does *not* make the other guy look any more comfortable; in fact, he looks like he's waiting for the wrath of God to be felt. It seems that Radio Shack has issued a bulletin to all employees forbidding them to talk about scanner modifications to receive cellular under the penalty of termination.

BTW, I'm not being critical of RS for the directive. They don't need the grief if someone goes after them on trumped up charges . . . again. (Didn't they pull most of their scanners from New Jersey last year after the state claimed that cellular images were appearing around 450 Mhz in the less expensive units?)

Mike, good to see you on here, again.
How about. At that frequency, what's the image? One could possibly tune
there.
I can't remember, though what the if is on those frequencies.
Guess is, though won't be a heck of a lot of differences on the image.>

Mods have been moved from ftp.std.com to oak.oakland.edu
look in /pub/hamradio/mods/tandy
use mget to get a bunch of short pro43*.* files which duplicate
much of their content with each other.

I have a Kenwood TH78A and have been contemplating plugging in all the cellular freqs for my area so that I don't have to do limited band scans when looking for cellular calls.

Does anyone have a list of the frequencies for all the different cells? How would I figure out which cells in my area are in use (listen I assume). Is it practical to type in all the freqs for a particular area?

Thanks,
John

>john.boyer@rd.eng.bbc.co.uk
>
>.
John Hoot of SSC in San Clemente CA USA wrote an article some
time back in 73 magazine about modifying an ordinary scanner to
have such a bandwidth. SSC sells a bearcat scanner already modified
for the 30-50 khz IF for about $150. You might try contacting them
at 150 Avenida Cabrillo, San Clemente, CA 92672 or at their BBS at
619-259-5554 or by telephone at 714-498-5784.
I have been using one of their WEFAX converters with a
Bearcat handheld scanner with no modifications. The results are
not too bad, but I would like to hear what kind of results are
possible with a receiver with the correct IF bandwidth.

Hello again Henry!

The problem is that images of paging transmissions leak into many
frequencies between 476-477 MHz, even with no antenna connected.

I think cellular phone is something like the repeater-aided communication
in amateur radio.
so, what is the uplink/downlink frequency (or what the magic is that)?

and one more question:
In cellular phone, I can hear his or her voice as well as mine,
What makes it possible?

>and what day of april does this go into effect. I don't have the cash
>to buy this scanner yet, so I want to know how drastically I'll have to
>budget myself! :-)

>Chris

My guess is that there will be no more diode (if they continue to sell the
2006). The code stored in the microprocessor will probably be changed such
that diode, or no diode, cell coverage will not be tuneable.

Legally, Canada is not affected by this Congressional ruling, but it is
possible that economic factors cause Tandy to only make a single model for all
countries. That would be unfortunate. I'm sure they still have lots of the
old microprocessors, so the cellular-modifiable units should be available for
a while in other countries. This is just speculation on my part however.

PRO means good, CON means bad. If PROgress means moving forward, then
what does CONgress mean? (I think we all know)

>Are the prices listed above reasonable or a pipe dream?

There is considerable discussion to this topic on rec.radio.shortwave but a short answer is that for $50 to $100 you will only be able to listen to the big powerhouse stations like BBC or CSM. These cheap radios don't have the filters or sensitivity to pick up weak stations. For a real cheap one I think the DAK 3000 model is rated pretty good. The Radio Shack models are made by Sangean (or whoever makes Sangean) and are decent radios.
There is a guy who posts a very long list of radio reviews. If you don't see it over there, I think I could send you a copy (about 3 months old).

>thanks

The 560XLT requires about 500mA of current. The RS supply you are using is probably about 300mA. This does not give the scanner's circuits enough juice to operate properly. When matching an external power supply to equipment, you need to make sure it has the same voltage as required by the equipment AND that the supply has a current rating of AT LEAST what the equipment requires.

1907. PRO-43 low FM mod: works?

Newsgroup: rec.radio.scanner
Date: 1994-03-21 15:31:17 UTC
From: gdallal@world.std.com
Message-ID: <Cn0ts6.KH0@world.std.com>

You've heard the expression "black thumb" with regard to gardening? Well, if there's such a thing as a "black soldering iron", that's me. So, I decided to have someone with experience do my PRO-43 mod for me. I called Cellular Security Group which advertises in Monitoring News and asked them if their mod included moving the diode to restore low FM coverage.

Their response was that they don't do that particular modification because it isn't effective. Apparently it's only part of a process that would require modifying 6 other components. While the mod would let you enter the frequencies, the wideband TV would interfere with listening to broadcast low-band FM.

Would someone with some experience with the low FM modification please comment? I am not an electronics technician so I may have misstated CSG's opinion slightly, but I think I've included all the key words and phrases, although perhaps not in the right order or connected properly.

I had been having some trouble receiving the local fire frequency, 33.7MHz, with the scanner stopping scanning, but usually not breaking squealch. I often locked it out just because it was annoying. After I did the cellular and low band mod, I realized that I was getting a lot of images from channel 3, one of which is a few KHz above 33.7. Although it wasn't until I was able to actually tune to channel three that I realized what the problem was, I definitely feel that it has gotten worse. Now I can pick up distorted broadcasts instead of just a random signal. I have considered opening the thing back up and remod'ing the thing, but I don't know if it is worth the risk again. I have never listened to anything in the range, but I did find some digital signals in the little mini land band that is in there somewhere.

Has anyone else had any problems with the mod?

BTW, the Cellular part works great.

Michael

Why don't you try connecting a VOX tape recorder to your scanner and let it run for a day? There are lots of possibile explanations for your different hit rates but this would rule out some of them.

Around here, they use the 151.625 itinerant (sp?) frequency. The radios are available at Radio Shaft. I would be willing to bet that the number of license forms actually sent in closely matches the number of times that the FCC bothers to look for non-licensed offenders on 151.625. I also hear a lot of other interesting use - like for truckers and kids...

I have a Sony 2010 I want to sell. It is a very nice portable SW
receiver, some say it has the best synchronos detector on the market.
It will tune the AM broadcast band, shortwave to 30mhz the FM
broaedcast band and even the aircraft band all in a convenient
book sized receiver. It includes SSB capability as well.

I have the AC adaptor, the owner's manual and the original box too.
I bought it new about 3years ago. It works perfectly. Price is $200
buyer pays shipping.

Need the cash for Dayton!

I can assure you that this is either your imagination, or a coincidence.
The mods only affect which channels can be entered into the scanner (i.e.
it only affects the internal computer). The mod in no way affects the
tuning circuitry, so it won't (and can't) make any difference to
channels you already receive.

From my earlier posting on the PRO-43:

A Note About 50-88 MHz Reception

.........the European
version of the PRO-43 has different coils and capaci-
tors in the low (mid) band front end filter. That
explains why the 75 MHz sensitivity isn't stellar after
adding diode D3 to enable 30-88 MHz coverage. [But my
modified PRO-43 does receives the proper signals in that
range.]

There is, indeed, a FAA reserved frequncy designated for balloons, and if I am not incorrect, it is in the 123.000 to 124.000 mHz range. I recall seeing it listed in either an older edition of POLICE CALL, or MONITOR AMERICA in the aviation frequency section. Of course, if this is a burning desire for any-one, I suggest contacting your local FAA field office located at all controlledairports.

There two very good sources for reviews of radios. If they are not at
your local library, they will probably be at a large bookstore. They
are _Passprt to World Band Radio 1994_ and _World Radio TV Handbook
1994_. Both review all sorts of current radio models (in addition to a
wealth of other swl information), and include street prices and plenty
of advertisements of companies to sell them to you mail order if you
desire.

Also, if you decide on a Radio Shack model, you might want to watch for
a couple months - they tend to go on sale every four to six months.

(Warning: This is somewhat random...)

Last night, three of my fraternity brothers and I were playing poker on the first floor of the house when another brother came back from a weekend at home, and promptly unloaded, among other things, three old sonobuoys. It seems that his brother is an oceanographer, and they were just laying around the basement. Apparently they were used for mapping ocean currents (rather than ASW for example.) His dad wanted to throw them out as they wer etaking up space, but said brother decided maybe someone at school would be interested in them, so he threw them in the trunk and hauled them up here.

So, today we got them out and examined them. Two of them have been opened before. One is small with a propellor-like assembly that evidently flips out and acts to slow down the buoy on its descent into the water. The other one (and the third one, which looks just like it) has a plastic parachute in it. We didn't take either one of them apart completely, but I think I have a basic idea of where the radio units must be in them.

I imagine that the two buoys that have been opened are probably "dead" as there is probably no way to turn them off once the two "buttons" on the bottom of the thing have been triggered. I am curious though - if we were to somehow activate the third, sealed buoy, and it's battery still functioned, what sort of signal does it put out, and is there any way we could monitor it? Alternatively, does anyone know what sort of radios these things have in them? Are they useful for anything other than sonobuoys? What would they be worth?

Also, are there things I haven't considered about these (like safety issues, illegal transmission issues, etc...) that we should be considering while we play around with these? We're over 225km from the ocean here, but we have a large pond nearby, and there's always the Connecticut River :-). If anybody knows anything about these, I can probably find all sorts of numbers and marking to help identify the things.

Thanks in advance and 73's,

I wish to thank everyone who replied to my request for info on a cheap SW receiver.

To summarize what I was told:

It is possible to get a decent beginner's receiver for about $100, but if I become serious with the hobby I will be replacing it. The next tier of systems seem to start at about $200. One message suggested a rebuilt receiver sold by Damark (I think). (If that person could resend the message I would appreciate it because I forgot to print it.)

I think probably a beginner's system is what I want at this time since I want I don't want my wife to kill me.

Hiya!! If you want a trap for FM(88-108mhz),try Radio Shack. They sell an FM trap for four or five bucks that works pretty well.....
The trap comes with "f" female connctors. I use one or maybe two in series and it really knocks down the FM interference.

I have a question,though on the Grove filters. Does anyone out there have trouble with Shortwave interference to their scanners?Or Am broadcast interference? I have always wondered why Grove hawks these things. I would really like to know if anyone out there has the kind of interference that this filter is supposed to eliminate(H.F. stuff).
Thanks.....

I have friends who live near broadcast towers, and they get AM
interference on their (hardwired? Uncordless? What do you call a
telephone that is not a cordless?) telephones. So I suppose if you're
close to a powerful transmitter you may require the filter. Seems like
an awfully small market, though.

Someone in one of these groups was looking for the part number of
the D4 diode. Here's a repost of an old article on the subject:

quote

First of all, thank you to all those who responded to my request for help
on the cellular modification of my Pro-43. The modification called for
removing diode D4 (which restores the cell band) and then putting the
D4 diode in the previously empty D3 position (which extends the lower band
between 54 MHz and 88 MHz). My problem was that I had damaged the diode
in the process of removing it from the D4 position and, thus, could not
extend the lower band. I realize that the extended frequency range is mostly
just TV channels 2 through 6, but it still might be fun to go exploring.

The solution: I got in touch with the Tandy Parts center in Fort Worth.
Their address and phone number is:

Tandy National Parts Center
900 E. Northside Dr.
Fort Worth, TX 76102.
(817)870-5600

I got a copy of the Pro-43 service manual for under $6.00 and a replacement
diode for $1.22 (Mfr's Part No. MA110). They were very helpful and were
more than happy to take my credit card number and send the stuff right out
via UPS. It arrived in less than a week. The diode is now in and works
just fine.

endquote

Here's a couple of other handy part numbers:

Pro-43 Service Manual: Catalog # 20-300/9300
Battery Case: Mfr's Part # GE-91D-9339

Source record: 276242

I was reading through the California Legal Code (available online at leginfo.public.ca.gov) regarding privacy laws and saw the following:

"632.7 (a) Every person who, without the consent of all parties to a communication, intercepts or receives and intentionally records, or assists in the interception or
reception and intentional recordation of, a communication transmitted between two cellular radio telephones, a cellular radio telephone and a landline telephone, two cordless
telephones, a cordless telephone and a landline telephone, or a cordless telephone and a cellular radio telephone, shall be punished..."

Ok, I had heard that monitoring cordless calls here in California was illegal. But what surprised me was that, in another section:

"635. (a) Every person who manufactures, assembles, sells, offers for sale, advertises for sale, possesses, transports, imports, or furnishes to another any device which is primarily
or exclusively designed or intended for eavesdropping upon the communication of another, or any device which is primarily or exclusively designed or intended for the unauthorized
interception or reception of communications between cellular radio telephones or between a cellular radio telephone and a landline telephone in violation of Section 632.5, or
communications between cordless telephones or between a cordless telephone and a landline telephone in violation of Section 632.6, shall be punished..."

Whoa! "eavesdropping on the communication of another" could be interpreted as listening to anything, not just phone calls, so how does Radio Shack manage to sell scanners in California (much less ones that cover 46-50 MHz)?

Inquiring minds...

Dan

Could someone please repost or e-mail the ftp info for the CA FCC freqs.

A cursory explanation how to use the search functions would also be appreciated.
I inadvertently deleted my info.

Thanks in advance,

Carter

An after thought -

Any Northern Ohio (USA) people know the freqs that the * Richfield Colesium *
uses? I noticed on one of the supervisors radios (?? green jacket/attitude)
that he had five channels -- each appeared to be assigned as inidicated by
a little post-it attached to the radio. The freqs are not listed in Police
Call or the Ohio Scanner Master pocket guide (no big one yet :(..)
I didn't have time to search the airwaves but there was alot of traffic on the
OSP district freqs and the Summit Sherriff North freqs, as well as the
surrounding town PD freqs. Physicians Ambulance and the Richfield EMS seemed
to be the two ambulance services, perhaps there were more...

Anyway, I was interested in the security freqs. The various CONCERT security
I identified was: Ohio State Police (traffic), Summit Sherriff (outside
perimeter), Local PD (extraneous duties ;), Colesium PD (had badges),
Green Jackets (supervisor), Maroon Jackets (supervisors??) Blue Jackets,
(general security), Red/White Rugby (Tight Security - Stage etc.), Yellow
Shirts (kids who get free ticket and shirt to hang out), Q & A booth.
The Ohio Alcohol Freqs were also active. I don't really expect to hear
from anyone with this info, but......

> than sonobuoys? What would they be worth?

These things used to be popular in the beginning days of 2 Meter FM;
there was an article published somewhere called the "sonobaby" that
showed how to convert one to the 2 M FM ham band.

The one I had had a saltwater activated battery that put out something
like 15 VDC and transmitted somewhere around 150 Mhz FM. There was no
effort made by the designer to miniaturize the circuitry, and it ran
something like 1 watt. There was also a timer circuit that melted a
fuseplug that sent the thing to the bottom after X hours of transmitting.
The body of the sonobuoy had about 100 feet of what looked like miniature
twinlead connecting the hydrophone to the FM transmitter.

I doubt seriously if the sonobuoy is worth anything other than a cur-
iosity point.

> issues, illegal transmission issues, etc...) that we should be

You can always take it apart, put in a ham band crystal and retune it.

: >2. Does anyone know any other frequencies like this used by L.A. radio
: >stations for their reporters, traffic helicopters, etc.? If it is illegal,
: >I really need to know the freqs so that I can be sure to avoid them.

: Yes it is legal. The main media frequencies are 450 - 451 and 455 - 456.
: Listening to the media can be very entertaining. When it comes to major
: incidents, the I often listen to the media freqs because they will say
: EVERYTHING over the air while the police will not.

You may want to re-read the ECPA again. These types of transmissions are protected. While listening to the same frequency you may hear technical discussions relating to setting up equipment etc , these transmissions are not protected.

Be sure to tune 450 - 451 every 12.5 kHz and 455 - 456 every 12.5 kHz for a local electronic news gatherer near you. I leave it up to you to determine if the content of individual transmissions on these frequencies is protected.

>is protected.

>Bob

I'm not sure I understand. Are you saying I can listen to the engineering type discussions on 450-451 etc, but if the guy is giving a traffic report that is being rebroadcast on some TV or radio station, its illegal? It seems like there would be a lot of gray area there. What if the same guy giving the traffic report is only being recorded for editing and later rebroadcast? What if a reporter is speaking to the studio, talking about a story, doing a sound check etc., and after a few minutes of talking, they begin a remote broadcast? Do I have to quickly change frequencies? How am I supposed to know if their fork-tounged gibberish is being rebroadcast or not?? How do I know I'm not listening to a TV program on how engineers set up a remote broadcast site?
I do have the ECPA on disk, but I've never read it all the way through (mostly because I won't feel any guilt if I don't know which laws I'm breaking) :-O

Can you clarify?

Put your hand over the speaker. :-)

Short of using a special audio filter, there is nothing you can do. The high pitch noise seems to come from the cell tower transmitter.

I'm going down to Atlanta GA next week for some Grateful Dead concerts.
I thought I might take my BC200XLT and see if I could pick up the
walkie-talkies used by the crew setting up the stage. One member of the
band (guitarist Bob Weir) also uses a "cordless" guitar rig.
Are the frequencies used here licensed to the group by the FCC?
Anyone who has this info. please share!

|My recomendation is to look at the Pro-2004/5/6 (all three models are
|virtualy identical).

Not quite. The PRO-2004 has 300 channels (modifiable to 400 easily)
and once modified for cellular coverage covers only the original
cellular band (base: 870-890mhz). The PRO-2006 covers the extended
cellular band (presumably, the 2005 does as well?) to 894 mhz in the
proper 30khz steps. [I've seen one person claim that late production
models of the 2004 cover the full expanded cellular, but I do not
know the veracity of this claim...]

|They have great sensativity and plenty of features to get

The PRO-2004 has mediocre sensistivity, made even worst by desensitizing
in the presence of strong FM stations. It is advised to use an FM trap
to minimise desense. Grove Enterprises sells a scanner filter which
filters this out, among other things. I should probably get one myself...
Being relatively insensitive, it also has good intermod resistance from
the scanner's urban nemesis, the Evil Mr. Pager Transmitter.

The PRO-2006 is more sensitive, but is also significantly more susceptible
to Mr. Pager intermods. Also, faster scanning than the 2004.

[This is a repost. The earlier version contained an unsubstantiated rumor that Grove was out of PRO-43's. I though better of mentioning it after posting and gave them a call. They have them in stock and expect to for a while. My apologies to those who were mislead by the earlier posting.]

It's April 24, but IMO it's misleading to think of it as a firm dividing line. On the one hand, any recievers still in stock may be sold until the supply is exhausted so, in theory, one can purchase such a receiver after the cutoff data. On the other hand, given all the notice, it's hard to believe that a large supply will be brought in at the last moment. That is, I suspect that most manufacturers and importers will follow their normal schedules so that the faucet may be turned off at the last typical ship date before the cutoff. If you're thinking of getting a receiver, I would suggest ASAP.

What is puzzling is what the net effect of the import restriction will be. The regulations forbid the import or manufacture of units that are easily modified by the end user. Units such as the PRO-2006 that need only a single wire snip would certainly be affected. The PRO-43 however requires partial disassembly and removal of a surface mount diode. Many would say that this fix is not easily accomplished by the end user. The manufacturers may bend over backwards, however, and produce units that are not modifiable, period.

> than sonobuoys? What would they be worth?

If it is anything like a standard Navy buoy, it broadcasts VHF-FM on one
of 99 channels, ranging in frequency from 136.00 - 173.5 MHz.

If you can supply the channel number (it might be printed on the buoy, or
selectable by a little switch on it), I can give you the frequency.

Hope this helps,
Tom Leber

The crew is on 469.500 and 469.550. They are licensed by the FCC to use these freqs.
As for the wireless gear, they could be on any number of freqs on three or four bands. These devices are covered by separate regs from the business band.

A while back, I wanted to double the scan/search rate on my Uniden BC205XLT
but had to order the necessary crystal in quantity. I have 19 of these
left and am selling them for $5 apiece, including instructions and shipping.

The mod works on the Uniden BC100XLT, BC200XLT and BC205XLT as well as the
Regency R2020 and R2030 as well as the Radio Shack/Tandy PRO-35. Please
email me for further info and my address. Thanks...

>RG-58. Most are made for RG-59 diameter cable.

Good reason for that - F connectors are for 75 ohm cable, i.e. RG59, cable-TV type cable. Most other connectors are 50 ohm impedance, i.e RG58, RG8. You can get 75 ohm BNCs, though. Not really that big of a deal unless you have to transmit through it. The cable that came with my Channel-Master "spider" antenna has an F connector at one end and a "Motorola" plug (like on the cable of your car stereo's antenna) at the scanner end - the old Bearcat scanners have "Motorola" jacks on the back.

1961. MVT-7100 -- A new Toy (Wow)! Need Some Help!

Newsgroup: rec.radio.scanner
Date: 1994-03-23 19:48:11 UTC
From: post1@ID1.AL.ALCOA.COM
Message-ID: <post1-230394144812@132.226.102.82>
Source record: 276267

I just recieved my MVT-7100 and WOW what a difference from my old Bearcat which had 10 channels and used crystals. Very nice unit!

I of course have not listened to Cellular phones because that would be illegal, but if I had I bet I would have had the following experience with reception and questions.

No matter how strong the signal indication on the meter is, there is (would be) a high pitch almost whistling background noise accompaning the transmission. Any one have any ideas on what this might be and how to illiminate it. Could it be the telescoping antenna? I was (would be) a little disappointed by the clearity of the reception, but really don't know if I should be. In my car alot of "broken" up transmission.

When listening to 869.040 - 893.970MHz should I use FM or WFM? WFM seems to give limited volume and no much better reception.

Regardless, I would like to try a better antenna on this unit to see what it will do. Any suggestions on a good to great BNC antenna and where to get one?

Finally, I would appreciate any explaination on the differences between FM, WFM, LSB, USB.
I know what the intial stand for and know they are difference bands, but would like some info
on how they are intended to be used, what they mean to me, etc... For instance, what's the difference between 869.040 MHz FM and the same freq. on WFM, or LSB or USB. Can someone define the bands for me. Sorry to sound like such a radio novice, but I am! I'm an engineer with a moderate background in electronics and such.

Thanks to all who provide information and addresses on this unit. Your a great bunch!

Hello everyone,

I've trusted your adive in the past and am looking for it again...

I want to buy one more 800(cell) scanner before the deadline...
And I'm trying to choose... (I already own a mvt7100)

Which is better? pro43 or 2500xlt?

Or should I go with an old dual conversion??? since I already
have the mvt-7100...

by the way the MAX I want to pay is around 330 US...

thanks again,
jason

>

Please be *extremely careful* with this device. The main battery is seawater activated, and there is a inflatable collar float that inflates and an antenna that is extended when it enters the water (actually, when two pins on the body of the sonobuoy are shorted). You don't want to be holding the device when this happens!

The signal is 1W, VHF-FM, transmit only. Old ones had a single channel, newer ones can select one of 99 channels (synthesized).

Be careful! And don't transmit out of band for whatever services you are licensed for.....

It is April 26th - gleaned from a copy of the ruling sent out by the FCC.

If I had to take an educated guess, I would look around the D29 or D30 area. I have not seen or heard of any mods for this unit, but the schematic shows that the difference between USA/Canada models and Europe/Australia are these two diodes (and a few other discrete components). Note: D29 is present in the USA/Canada model and not in the Europe/Australia model. The diagram looks like a surface mount type. You should also note that D29 is shown as type MA141WK (Marked MT) and is a strange looking beast. It has two anodes and one cathode.

If you need a schematic for the beast, drop me a note.

: No matter how strong the signal indication on the meter is, there is (would
: be) a high pitch almost whistling background noise accompaning the
: transmission. Any one have any ideas on what this might be and how to
: illiminate it. Could it be the telescoping antenna? I was (would be) a
: little disappointed by the clearity of the reception, but really don't know
: if I should be. In my car alot of "broken" up transmission.

I experience this on a number of portable scanners. It may sound screwy,
but by holding the scanner so that your thumb covers the top two slots
of the speaker, the high-pitched audio whine nearly goes away.

: When listening to 869.040 - 893.970MHz should I use FM or WFM? WFM seems
: to give limited volume and no much better reception.

All signals in this frequency range are FM, not WFM.

: Finally, I would appreciate any explaination on the differences between FM,
: WFM, LSB, USB.

Each of these is a different modulation system. Most WFM is used in the
VHF/UHF ranges for broadcast transmissions (FM and TV audio broadcast); with
very rare exceptions in some VHF/UHF ham bands, all other VHF/UHF
transmissions are in FM mode (actually called NBFM, for narrow band
frequency modulation). USB and LSB are versions of AM signals, in which
one of the two sidebands is suppressed. By transmitting only one sideband,
the station occupies less of the frequency spectrum. You'll find USB
signals in the amateur and commercial segments of the HF spectrum, with
LSB primarily used by amateurs in the 1.8, 3.5, and 7.0 MHz bands.

Enjoy your Yupi!

Well Jason,
Brett Miler will probably get on my case again,because I'm going to trash the Uniden 2500 AGAIN,but I don't care.In my opinion,the 2500 is such a piece of crap,it should never have been released!I recently played with another one that wasn't any better than the first 2 I tried before.Intermod is so bad that you have to lock out a lot of channels to keep the thing scanning.My 43 had ONE freq that had to be locked out(155.070)to keep it running.Images are all over the place and there are lots of birdies too.All the bearcats seem to be prone to picking up RFI from TV's,CD players,computers,etc.,unless you hook up an outside antenna,and if you do,the intermod problem becomes intolerable!Sure,you can use an atenuator,but it's pretty silly when you can buy a 43 or 2006 and not have to put up with the 2500\890\8500's B.S.!Sure,the 43 has weak audio,a tiny display,and not as many bells and whistles as the 2500,but unless you are a railfan,you'll notice it doesn't have intermod either(compared to the 2500)! In short,the 43 is a real radio,the 2500 is a good case and controls\display,and not much of a radio.If you want to buy a 2500,make SURE you can take it back!A friend of mine bought one for COST,and took it back and just got a 43,for about 275 bucks.

>Yeah,the whine bugs the shit out of me too!Here's a little parts list for a cheap little filter that will chop off MOST of the whine.If you do it right,you can jam it into a lapel speaker,like the one RS sells,it's not easy to cram it in there,but it can be done.Actually,the hardest part is finding SMALL 100mh chokes!The RS ones,part#273-102,are pretty big(you need 3)and you also need a #272-990 10uf NON POLARIZED cap.I have this filter or one like it,on all my scanners,it makes listening much more pleasant!
Put the cap across the speaker leads.Solder the 3 chokes in series and tape or hot glue them into a "brick".Remove one wire(either one)from the speaker,and solder it to one lead of the chokes,and solder the other lead on the chokes to the speaker where the wire was you just removed.Now listen in comfort!If you have a base scanner,you can put it inside to make it more convenient.You can also put a 3 position switch in there to make the filter "adjustable",but it's usually ok with all 3 chokes in line.If you feel like playing around,you can play with the values of the cap and make it sound,IMO,really bad!
A really cheap way to kill the whine is just turn the radio sideways!It works ok,and it's free!Good luck,let me know if you like the filter...
BTW,I'm looking into finding a source of TINY chokes and caps to make a really small version of this filter to fit inside a 43 or Bc 200,etc..

>Unfortunately, it does not mention the model name on my Dak catalog.
>$249 is the price.
>
>James Choi

James, somebody has posted that DAK will take orders for items they do not have in stock. I ordered a radio earlier this week from DAK, and here is how my conversation with the order clerk went:

"I'd like to order item number such-and-such."

"Let me check to see if that item is available." (Pause.) "Yes, sir, I am showing that you may order that item at this time."

"Do you have it in stock?"

"My computer is showing that you may place an order for that item right now."

"BUT DO YOU HAVE IT IN STOCK?"

(Pause.) "Sir, I don't know."

I went ahead and ordered, after demanding confirmation that my credit card would not be charged until the item was shipped. Since I'm in no hurry for the radio, I don't mind waiting. But I'd be really ticked off if I was in a rush to get an item and they misled me like this woman tried to do. ---Dan

While I don't have the frequencies handy, rest assured that you DO need a license to operate on all these bands. To my knowledge, the only bands that do not require a FCC license (in the US, of course) are the CB band, and the two "garbage" bands: 900MHz cordless phones, and 46/49 MHz stuff. There may be some scientific research frequencies that don't require a license, but I can't remember for sure.

Yes, Icom missed the boat. It appears that the R7000 was not designed to be a scanner, but rather a comm. receiver. There are 2 solutions that I know of.

1. I have heard there is a mod than can add a 2-second delay, like normal scanners - I might have this mod, but I'd have to check.
2. Get computer control (with the CI-V interface). IMO, this is the only way to scan with an R7000. The 99 memories and only 1 "bank", are very limiting without PC control.

>advantages/disadvantages/cost. Any suggestions appreciated, including the
>lowest $ supplier. Thanks in advance!

As far as which one is better, I'd say:
1. AR3000A
2. 2006
3. R-100

As far as VALUE, I'd say:
1. 2006
2. AR3000A
3. R-100

unless HF is important enough to tip the scales in favor of the 3000A. The
R-100 has no BFO, so HF is of limited use.

The R-100 IS a good radio, but not a great scanner WRT: User interface,
channels, banks. etc

For Prices, check Grove, Marymac, EEB, Universal Radio

To: All

There's a new full coverage handheld scanner, available from Javiation and ACE Communications! It is made by Nissei Electronics, the same company that made the AR1000/1500/2000/2500/2800. This one is definitely better than those, yet still exhibits some of the strange quirks (odd-acting squelch action), though to some degree these are alleviated by using the Attenuator button. It doesn't attenuate the signal very much, though just enough to get get rid of overload.

The Camnis HCS-050 (Javiation) and Trident TR2400 (ACE) have uncut coverage from 100kHz thru 2060MHz, though they are deaf on LW and MW. SW reception is pretty good and VHF/UHF sensitivity is excellent on most freqs.

The Nissei handhelds have 1000 channels with 10 Scan banks and 10 Search banks. Like in the AR1000, you may link any Scan or Search banks. And you can lockout up to 50 freqs per Search bank. Programming is easier and more logical than with the AR1000, though it still isn't as simple as the Yupi or RS scanners.

This scanner is powered by 4AAs. 600mAH nicads (Hitanica brand) are included with both the Camnis and Trident. Also, an ok-for-USA AC adapter, 12 cig lighter adapter, carrying strap, earphone, and rubber duckie are included. No carrying case is included. The scanner's construction is quite good (seems to be higher quality plastic than the Yupi's) and the audio quality is very good, almost as good as the Yupi's. On 800MHz <g>, audio is NOT distorted like on the Yupi at times.

Pricing from ACE is $500 plus shipping and from Javiation is around $465 INCLUDING shipping. Both include English language manuals. And both units are completely uncensored. Increments may be set from 1-999kHz.

The Camnis/Trident has some really neat features, like the ability scan FROM any channel TO any channel. Also, YOU may determine -at any time- what mode you want the scanner to "wake up" in (ie scan, search, manual).

Modes are AM, NFM, WFM, and SSB/CW (with BFO knob). No problem picking up and tuning in 20m Hams, for instance.

I like the new Camnis a lot. True, it isn't a Yupiteru MVT-7100, but it doesn't cost as much either. And it does several things that you can't do on a Yupi (ie linking Search banks, switchable display light!, Channel linking, selectable wake up mode, and variable Delay 0-15 seconds). Most importantly, according to Terry Kenny in LA, the Nissei handheld is CLEAN on 470+MHz!!! This is important in NYC, too, as well as other cities with lots of UHF activity up there. (The Yupi is infamous for intermod in that freq area.)

Overall, the Camnis/Trident is an exciting addition to the world of continuous coverage scanners. Too bad it'll only be available for sale in this country -uncensored- for the next month!

In the AES ad in the April QST, there's a box that says 'Last Chance on ICOM recievers and selected Handhelds, buy now before the FCC law...' and they list the R-1,100,7000,7100,9000 and some HT's.
I haven't had a chnace to call AES yet, but I'm going to.

1990. Question about ICOM R7000

Newsgroup: rec.radio.scanner
Date: 1994-03-24 15:50:05 UTC
From: wal@genrad.com
Message-ID: <2mscrdINNrqk@puff.genrad.com>
Source record: 276143

Hello netters.

I have just recently acquired an ICOM R7000 multi-mode receiver/scanner. I was playing around with the scanning operations and think I've found something annoying.

My question is : Is there a delay scan mechanism which works the way one would expect?

There is a delay scan control which has 4 positions: Off, 5 sec, 15 sec, and infinity.

Off - Scan stops when a signal is heard and restarts when carrier drops.

5 sec - Scan stops when a signal is heard and restarts after 5 seconds, regardless of whether or not there is still a signal.

15 sec behaves like 5 sec.

Infinity - Scan stops when a signal is heard and does not restart.

I was expecting the 5/15 sec operations to stop the scan when a signal is heard and wait 5/15 sec after the carrier drops and restart the scan if nothing is heard. If something is heard during that period, the scan should still be stopped and the "clock" doesn't start again until the carrier drops again. This is what I think of when I hear the term delayed scan.

Am I doing something wrong, or does the R7000 really have no honest to goodness delay scanning function? If not, Icom really missed the boat on this one.

Thanks in advance.

Well, of course evryone could be wrong, but one MT article and a
conversation with a local dealer both indicate that the R-7000, R-7100
and R-9000 will still be available after the ban. It may have to do with
the type acceptance they qualified for originally, i.e., general
coverage communications receiver vice hand-help spy toy :-)

: The #3 key on my Pro-43 will not work. Any suggestions? What about
: warranty? Thanks.
:

Warranty should cover it, if still good. If you have lots of freqs.
programmed in, it may be worth it to take the thing apart (but be
careful!!) and try to clean off the contact, both surfaces (the
conducting part of the bottom of the button as well as the contact
surface on the board underneath). I'd use a damp (water) clean
cloth (not paper towel) and wipe gently, let dry. Reassemble
and see how it works. If still inoperative, then return to RS.
If it's been this way since you bought it, look for a buggered up
circuit board trace around the area of the button. If found, probably
return it, since circuit traces are tricky to fix but can be done.

Mike

Last year they announced they had bought out Radio Shack's "last" shipment
of PRO-2006's. The next month they published a retraction.

Take what Grove tells you with a grain of salt, on this type of thing.

Correct me if I am wrong, but doesn't this ban apply only to
scanners/recievers (whatever) which are imported by a company for sale.
If you lived in say, England, and owned one, and moved into the US, wouldn't
it be legal to take it into the US. If this is the case, why can't you
find a friend or relative (out of company), who can buy this equipment
and send it to you as a gift.

Hi,

Anyone have any knowledge or experience with the uniden MR 8100A? My "Scanner World" catalog gives the basics, but I still have a few questions:

1. Is this a double or triple conversion radio?
2. How is it with intermod? This is most important since I live in an area that's saturated with FM broadcast RF.
3. Full 800 mhz coverage or restorable?
4. Good quality?
5. How's the reception for distant public service stations and 2 meter ham?

thanks in advance! Mark

For 135, it's not too bad. There's no 800 coverage, but other than that, my only gripe is all the intermod and images. It's a double-conversion scanner, and my primary problem is the air band showing up smack dab in the middle of the 155 police range. One local freq used by united air walks in on my local police dept. freq. It doesn't overpower the police, but it's enough to break squelch and be quite understandable when the police aren't talking.

Good points: easy to modify for several things: backlight switch to keep it lit all the time; (if it's the right board) add 100 memory channels to make it the full 200; change the crystal controlling the computer to make it ~42 channels/sec scan; reception of 66-88 MHz instead of 29-54MHz (but since coils, etc. are different, reception is not too spectacular). Has a removeable rechargeable battery pack (and people will argue whether that's better or worse than AA packs), 12V plug on back (so can plug straight into car lighter), bright big display, good audio, etc. I got mine new for $95 dollars (store display model, then store went out of business and sold everything for 50% off (tells you a bit about their original highly inflated prices, no?), and have had fun modding it for the past two years.

One side note: since this critter has a removeable battery pack, I finally did something i've wanted to for a while: I carved a base mount for it out of wood (I didn't have any plastic of the right kind) to mimic the top of the battery pack, and put two screws with wires attached where the contacts are. Running wires off from there (making sure on the polarity), I can now power the CPU part with speaker, external power and antenna, all while recharging the pack without the load of the scanner running all the time. So when I go out, I grab the radio unit and the now continuously-fully recharged battery pack. (Don't argue too much about the wisdom of leaving a pack on the charger continuously, please. I'm aware of the possibilities.) Main reason it's nice is that the base now holds the radio unit at just the right angle for viewing, and I can stab at the buttons to stop it from scanning without the scanner falling over.

I found another very important usage for this base during the last major ice storm out here in the western part of Virginia: when we were without power for 3-5 days, and I ran down my battery pack, I put it on my car charger, and simply lined up the older batteries I had lying around (d size, AA, doesn't matter) until I had the proper voltage, and kept happily scanning. (There's a way around the problem of not having AA packs :-)

> that particular model?

No, like all good radio enthusiasts, I stay away from the FCC :-)
However, my local dealer told me that they are still going to sell the
R7100 and R9000 after April 26 based on information they have from Icom.
This was also so stated by Bob Grove in MT a few months ago in one of
his diatribes against the ECPA. There are alos numerous Racal, HP and WJ
receivers that would ostensibly be covered by the ban but are not
because they are *communications receivers*.

The FCC makes numerous type acceptance distinctions about a wide variety
of equipment including computers, TV sets, car stereos, lighting
equipment and a host of devices which are not what one would normally
consider transmitters or receivers in the general sense.

If WJ et al can no longer make equipment that covers this range how is
the NSA gonna listen to your momma talking to the Ruskies about Rush
Limbaugh dating Hillary Rodham in high school???

Well,Brett,that is a good point about the adapter kludge. I have
bought into Grove's philosophy about using RG-6 type cable with the
"f" connectors. I bit the bullet and bought some f to n adapters
for the r7000 and 7100 and the setup seems to work just fine. I know
that the cable is "75 ohm" cable,but there are a lot of factors that
affect what an antenna SYSTEM's impedance is at any particular
frequency. The best way to go,of course,would be 9913 cable with
"N" connectors at the antenna and at the receiver. Someday,when I have
a lot of time I need to replace my feedlines and connectors.....it's
been a while. Good Luck es 73.......Dan-WA0JRD

2011. BC 70 XLT not working

Newsgroup: rec.radio.scanner
Date: 1994-03-25 14:20:42 UTC
From: geiste@hsi.com
Message-ID: <Cn856J.HI0@hsi.com>
Source record: 276167

When powering up my BC 70 XLT, it will display the 1st freq but won't scan. There's no volume also. You can step through the freqs by hitting MAN or hitting scan. Since there's no volume, I can't tell if it's receiving anything either. Search won't work either.

Everthing else seems to work properly. Just no scan, search, and volume (what's left? :-)).

The problem started after unplugging it from being charged and turning it on.

Any ideas?

Thanks!
Doug

This hasn't been tested yet, but your supposition _does_ apply to bringing in for personal user radio gear that has not been FCC type accepted. When I had someone purchase an early Icom R1 for me in Japan, the customs form had a blank for this personal use issue, thereby bypassing the need for type acceptance. I guess it's a question of someone willing to be the first guinea pig on this regulatory issue.

Not me!

I'll bet that will work, since:

1. It's not illegal to OWN a cellular-capable scanner, and since it
was GIVEN to you as a gift. It simply is on it's way across the
pond to you.

2. I believe the import ban is for retail sales, which would
logically include a gift. Getting it thru customs may be
an issue, don't know if the FCC addressed that part of it.

Mike

Okay...here I go, showing my technical ignorance...

Is it possible to intercept data transmitted from MDT's? It would appear to me (with my limited understanding) that these "radio signals" could be received, and translated by a third party.

This, to me, would be a very scary thought, if, it was indeed possible.

Thanks for any "input"

I called AceComm today to order a TridentTR 1500 (same as AOR 1500) and they told me that the 1500 was discontinued and replaced with the 2400. It is a handheld unit covering the same area as the 1500 but with added improvements, what that means she didn't say. Well does anyone know anything about this unit. I hope I didn't just get hit with the old bait and switch.

I do know that ACE is carrying the Tridents because they lost there franchise agreement with AOR and that Trident is exactly the same on the insides. Guess I'll
know for sure on Monday or Tuesday. <G> Pray for me.

Raycom, as such are no longer. Several years back they were
"taken over" by Icom UK (with a little bit more to it than that !)
I beleive Ray Withers (Mr Raycom) continued to be involved in
commercial PMR but I'm not too sure.

The "Raycom" shop still exists but, as I say under the Icom UK banner
but as far as I am aware they no longer offer the mod to new or old R-1's

2028. Icom 7000 vs. Icom 7100

Newsgroup: rec.radio.scanner
Date: 1994-03-26 14:08:32 UTC
From: kohn@ICSI.Berkeley.EDU
Message-ID: <2n1fl0$q0g@agate.berkeley.edu>
Source record: 276085

What are the main differences between the Icom R7000
and the R7100. Is the R7100 in every way better than
the R7000?
I want computer control and software availablity, etc.
I am also interested in what feedback the computer can
get about a frequency being searched. Can it distinguish
noise from human voices (should be not to hard) - or
estimate the signal/noise ratio (there are some fairly
simple methods to do this involving histograming the digital
audio data...)? I want to be able to automatically search
for frequencies and record the ones that machine at computer
defined pattern - is this possible w/o putting the output
of the scanner into an A/D card (maybe not such a bad idea).

What about the R9000? Does anyone want to post the specs
on this one so we can all drool over them. Doesn't it have
a CRT monitor of the spectrum around the tuning point?

Is the AR3000A in the same league as the Icom's?
Should I consider it as well. Is the software support
as good?

Thanks
Phil Kohn

I will gladly summarize emailed responses on request.

>FM signal? Would a broadcast station be licensed to operate on 25.95MHz?

It's probably FM, and it's probably a studio-transmitter link ... since
that's the useage that 25.95 MHz is allocated for by the FCC.

To all those who have or were planning to respnd. to my offer of NH codes, I forgot to tell you that all I have is a HUGE binder full of loose leaf paper, so try not to request the "whole thing" . It would take me days to cover all the material. I'm working on a project right now to post a fairly complete list of all the "major" codes right now. Send specific town requests only and I'll include the State Police, US Forest service, Fish and Game, etc. Again, sorry about the mix up.

An IV infusion of Ringer's Lactate at a "To Keep Open" drip rate,
also know as KVO, "Keep Vein Open". Think of Ringer's Lactate as
sterile, unsweetened, unflavored Gatorade and you won't be too
far off the mark -- it's a common IV solution. The idea is to
establish the IV just in case the patient becomes worse, or
suddenly needs medication, which can then be given through the IV.

I've thought about doing that before, but I have two questions about it
that I've always wondered about:

1) Does having an FM transmitter so close to the receiving unit generate
any interference or desensitization or anything like that?

2) Is the output of the receiver in mono or stereo? The box wouldn't say
and I didn't feel like asking the RS salesdroid.

It does seem like a pretty good idea.

--
T.J.

P.S. The ignorance of the RS people can be a plus - when I got my Pro-43,
they gave me the display unit (works fine), with the batteries included.

>flying out as soon as the plastic shell is opened...
>
>

Tim,

You only need to take the two screws on the "top half" from each
side. You can leave the bottom ones in. Remove the four screws (2
either side......err.....) and gently prise apart the two halves.

There are no connecting cables between the two haves just three
connector blocks.

Nothing will come flying out at you other than.........

...just be careful and keep your eyes on the buttons down the
side, they do sometimes slide out and do have a "right" and "
wrong" way of going back in".

The keypad is a one peice moulded affair so that won't give you
any problems.....

...and it goes back just as easy !

>Thanks..E-Mail - Ligosa@pipeline.com

There is no scanner that can receive "all" frequencies. You can buy scanners that receive a very useful sub-set of all frequencies. The most popular scanners cost from about $150 to over $600. If you want an inexpensive one that has cellular and cordless coverage, expect to pay about $250 or so. You probably want to read this group for a few weeks, as well as "monitoring times" and "popular communications" magazines that you can buy at most news-stands. Most scanner sellers advertise in these magazines.

I can vouch for the fact that reversing the polarity from the cig lighter
will fry the 200xlt. I blew up my first one about 30 mintutes after I
got it in 1990. With the polarity switched properly, it worked great when
I got my new 200xlt.

Be careful!

Waitaminute!!! Aren't the Icoms non-scanning recievers? I thought that the 'anti-cellular' law was only targeted at multiple-channel scanning radios, not single-channel-at-a-time recievers....

2058. Buying A Scanner -- Advice Wanted

Newsgroup: rec.radio.scanner
Date: 1994-03-28 06:45:43 UTC
From: mrw13@bonjour.cc.columbia.edu
Message-ID: <2n5uen$678@apakabar.cc.columbia.edu>
Source record: 276116
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I am interested in purchasing a scanner and would like some advice as to what are some good models the general price range? I am not looking for anything too fancy, although, in addition to the usual police, fire, etc. frequencies I would also like to pick up aircraft frequencies. Picking up the cellular or cordless frequencies is not that big deal to me and I know that you usually have to get someone to "modify" your scanner to do this, but I would still be curious as to how much this extra feature would also cost. Please email any responses.

Thanks in advance,

Marc Wollemborg

2059. Best way to have hrs of recording time?

Newsgroup: rec.radio.scanner
Date: 1994-03-28 08:29:06 UTC
From: edward@cs.ualberta.ca
Message-ID: <2n64gi$89j@scapa.cs.ualberta.ca>
Source record: 276117

I've been listening to past discussions on taping off
a scanner (ie use a voice activated unit etc.) and have
been wondering how to get more recording time. So far
I see few alternatives to using a VCR (gives 6 hrs),
which is obvious overkill (+very slow start-up time).

Any ideas??? Surely there must be commercial units available?
I am trying to avoid buying a modified "standard" recorder as
the quality of recording is likely to be low (or am I wrong?)

Thanx in advance

edward@cs.ualberta.ca

Take the broken piece down to a welding shop and see if they have a rod with
the same diameter. It is not that difficult to add threads to a rod.

>The AOR had better scanning features. Overall they characterized the
>AOR as a scanner with wideband coverage and the ICOM as a wideband
>receiver with scanning features.

I saw on Compuserve that some guy in Europe wrote a review on the AR3000 and did some comparisons to the R7000. He seemed to like the AR3000 better. The article said it could not be sent to other computer systems, so you will have to get it yourself from CIS.
When the AR3000A arrives, I plan on doing a comparison to my R7000. I'll post it here.
As a side note, I am trying out a 30 trial membership to CIS. So far my impressions of the scanning forum are mixed. They seem to have some great files for computer control and lots of neat things, but the messages seem a little brain dead (no offense to CIS users, but topics seem to ramble on, well past their usefulness). I'll stick to Usenet, thank you.

>his heart's content...

I went down to RS and got one. The sales guys had never noticed it before. When I told them how it could be used for TV, scanner, stereo, games etc. he thought it was pretty cool. His response was, "Figures RS is discontinuing it." I haven't tried it yet but it comes with an FM receiver/transmitter (89-93 MHz) with stereo send and receive. It has headphones and patch cords. I still haven't tried it out, but my theory is to increase the transmitter supply voltage a little bit to see it power output can be increased (without burning it up).

>I am trying to avoid buying a modified "standard" recorder as
>the quality of recording is likely to be low (or am I wrong?)

There are some 10 hour recorders advertised in MT and Plop Comm, but the price scares me away. They are about $100 or more. Once I was playing around in my RS vox recorder and damaged a resister. TO my surprise it slowed down the motor about 30%, so I get more recording time. But, as a warning, I did this once before to a tape recorder, and the motor burned out shortly after (a slow motor draws more current and can be damaged).

A vox controlled VCR still seems like the best way (assuming that you have an old one lying around). Switching the pause on and off with a vox circuit, doesn't seem like it would be that slow.
I also saw someone post that they have the sound fed into their Soundblaster card and they just store it on disk. At low sample rates, it seems like you could store a lot of info (depending on disk space).

Thanks Mark for your opinion, I am new to scanning
but would like to learn more. I have been reading and
following rec. radio. scanner for a few weeks now and am
starting to get aquainted with the jargon and the equipment
involved. I have the BC2500xlt on layaway and the owners
will let me select another model if I like. I want a very good
scanner around $500.00 is okay as long as the scanner is
as valuable as the price. So you say the BC2500XLT is a dog
could you elaborate on this just a little and perhaps make a
reccomendation for another model/option.

Thank you very much for your time.

Mike

>not single-channel-at-a-time recievers....

No, the Icom R7x00 and R9000 will scan at 10-15 channels per second under internal control and faster under computer control. Icom has a *Window Scan* mode which allows for fairly sophisticated foreground/background scanning but there is only one RF/IF/DEMOD section which means only one frequency can be monitored at a time.

All cheep (< $10,000) receivers and scanners that I know of only scan a single channel at a time. Some of them just do it faster than others. I have worked on receiving systems that used multiple receivers to scan various frequencies under computer control but these are not for sale commercially. Only Uncle Sugar can afford these puppies.

Having worked in a few of the factories in China that Tandy contracts with,
let me just say that quality is not a major concern. Their testing is
minimal, so defects do pop up often. When you exchange it, bring your scanner
to test it out before you take it home. It is always possible that the one
you have was returned by another customer, and found its way back to the shelf.

>wireless stereo headphone for my TV. Works great for $20.

Just went down to the local Radio Shack to pick up one of these
after seeing it in the newsgroup. Had to convince the clerk that
it existed (found it in the catalog for him), then find it on the
shelf. In any event he had it so I took one of the new Radio Shack
catalogs sitting on the counter, used the $3 coupon to pay for the
catalog and the $5 off coupon to lower the price. Walked out with
the unit for $15.

Seems to work well,

Enjoy,

Steve

: Can someone recommend a cheap easy way to build an antenna for my PRO-39
: scanner? I bought the coil whip and it's definately better than the
: rubber duck but I desire a little more range. Thanks.
:
: --
:

Getting more range also depends on how willing you are to have
an antenna that is more sensitive in just a particular frequency range.
I carry a few antennas for my scanner that pick up different
freq ranges better than others (like a photographer has different
lenses). So, what frequency range(es) are most important to you?
You can get different antennae (or build different ones) for things
like 46/49Mhz cordless, 120-160Mhz aircraft, 144Mhz ham, 440Mhz ham,
and so on. BTW, I found that just a regular portable cellular phone
antenna (with at TNC to BNC adaptor) makes a GREAT 800Mhz antenna
for a scanner.

Hope it helps.

Mike

: >Would 806-824, 849-869 and 894-956 cover them all? Why those
: >gaps?
:
: Those gaps are the cellular frequencies.
:

To expound upon that, mobile phones transmit roughly from 824 to 849,
the repeater bases transmit roughly 869 to 894. Receive freqs are
of course the opposite. There are just under 900 channels and it's
almost impossible to track them with a normal scanner. Channel
spacing is 30Khz, and mobile/base Tx and Rx freqs are 45Mhz apart.

These two ranges are the gaps you see in your scanner (most likely).
Just about everything else in the 800mhz band is trunked public safety.

Hope it helps.

[stuff deleted]
: What resulted was a few smoked boards and a $60 repair bill. As I found out,
: voltage on some vehicles can vary between 10 and 18 volts, depending on

This probably won't be a problem as most things have a voltage regulator
that will deal with this. What I would definitely suggest, however, is that
if you decide to build one (a cable) yourself (a fairly trivial task,
actually) that you add an inline fuse on the positive line.

I'm not an EE, so maybe someone with more knowledge in general and more
knowledge about the insides of a 200 can comment.

Yeah, I *love* my '43 given that my last scanner was an old BC70XLT.
The technology has come a long way. You have to look at what you're
paying for, though. The 2500 gives you a lot of neat, useful features,
but won't stand up in places like Washington DC where there seems to be
a paging tower every 15 feet. The '43 does better in such situations,
but your money is going toward better RF filtering/performance instead
of more features. The '43 is not *immune* to intermod, either. I have
problems with it from a number of paging towers. Also, when driving
around parts of Arlington and monitoring their 800 MHz trunked system,
I have to *remove the antenna* to avoid being blasted by the trunked
system's data channel of the day bleeding into the next closest
channel. Funny that it still gets good reception without an antenna,
though :-). Unfortunately, taking off the antenna causes me to lose
everyone who isn't nearby and on the higher bands.

The point is that there's a trade off and you need to decide based on where
you live. Maybe you can buy a 2500 from somewhere that has a decent return
policy and see if it works in your neighborhood?

Regards,
Neil

Actually, Lactated Ringer's solution is electrolytes only (a mixture of
sodium, chloride, potassium, etc.) in concentrations equal to that of
human serum. D5LR has 5% dextrose added. "TKO" stands for "to keep open"
as in, a minimal flow rate sufficient to keep the vein patent and the IV
flowing and ready to use to administer drugs, fluids, etc. You may also
hear the term "KVO" which means literally "keep vein open" and refers to
the same concept.

Hope this helps.

Stan

Cross-posted to: rec.radio.scanner,rec.radio.shortwave

>>> USA readers, rush down to Radio Shack and get yourselves a
>>> "Silent Play," 270-1715.
>>

I picked up two today, along with a "D" battery holder. Now I can place
my scanner under my desk at work and listen away without "What's THAT?"

I found it works just fine next to my PRO43 (although I was only scanning
140 and 440 - your milage may vary)

Someone asked about the specs:
Archer Catalog # 270-1715 "Silent Play" Blue box with kid pictured
playing Sega game. It comes with "transmitter" and "receiver", a stereo
headphone, stereo headphone patch cord (4") and RCA mono patch cord
(4"). I haven't tested the range, although it works fine throughout my
2,000 sqft condo. Techie specs:
supply voltage . . . . . 3 vdc
frequency range . . . . . 89-93 mHz
Spurious response . . . . 20 db down (what is that?)
distortion 1.0%
pre-emphasis . . . . . 75 usec
field strength . . . . . <48 dBu/m@3m
oscillator drop-out voltge 1.8 v
current consumption 9 ma
channel separation . . . . 25 dB

Controls on the transmitter include: OFF-MONO-STEREO, LO-VOL-HI,
frequency range of 89-93.

I would like to know how to increase the range of the transmitter -
(without having a FCC-rep knocking on my door)

>One comes to mind. "it's the only scanner I've owned that I wouldn't
>buy again" WHY??????????????????

hi,
If this is to be your one and only scanner, it is probably not the best choice. If you already have a scanner and are looking for one for portable or concealed use, the R1 is excellent for this. Its primary attribute is its extremely small size. No other scanner can match this. Others do have better technical specifications and performance but cannot be hidden your pocket.

There was at least one company with a upgrade for the R1 with different IF filters (I think) but they may not exist anymore....

For its purpose, I think the R1 is the only thing in its class but if you just want a general purpose scanner, you could send less money and have better performance if concealed usage is not important to you.

Stuart,

One of the very best is the ICOM R-7100 which sells for about $1400. You will also need to buy an interface and controlling software such as that made by DeltaComm (cost about $400). Another option is to get a Radio Shack PRO-2006 (about $400) and get a interface kit from Bill Cheeks (hertzian bbs) who came up with most of the mods for the 2006.

Good luck!

2092. Useful channel "banks"?

Newsgroup: rec.radio.scanner
Date: 1994-03-29 04:16:16 UTC
From: carmean@coyote.rain.org
Message-ID: <2n8a2g$5re@coyote.rain.org>
Source record: 276050

Do there exist scanners in which one can dynamically change the size of the channel banks? I'd like to be able to set up functional groups that do not necessarily have 10, 20, or 40 freqs. For instance, I'd like to be able to quickly turn on media freqs if I hear of a newsworthy incident on the public-service freqs. Similarly, I'd like to be able to group, say, law-enforcement freqs by city, or separate city and county fire from state and federal resources. Most of the groups would have far fewer than the 40-channels my PRO-2006 has per bank. Of course, I can accomplish this now by wasting channels.

Seems like this would be a trivial software mod, with maybe a new display to replace the LCD bank elements with some numeric bank indicator.

2095. System 7.1

Newsgroup: rec.radio.scanner
Date: 1994-03-29 04:27:24 UTC
From: an85347@anon.penet.fi
Message-ID: <043321Z29031994@anon.penet.fi>
Source record: 276053

WELCOME TO SYSTEM 7.1

This document provides late-breaking news about System 7.1. This information is not in the documentation that came with your software. For all other questions, refer to your Macintosh software documentation.

APPLESHARE SERVER SOFTWARE

To install an AppleShare file server or print server on a Macintosh using System 7.1, you need AppleShare server software version 3.0.1.

APPLE IIe CARD SOFTWARE FOR THE MACINTOSH LC II

To use the Apple IIe Card with System 7.1 on a Macintosh LC II, you need version 2.2 of Apple IIe Card Software. You should upgrade to version 2.2 only if you are using your LC II with System 7.1. Apple IIe Card Software 2.2 may also be used with the original Macintosh LC, but it is not required.

You can obtain the upgrade package from an authorized Apple Reseller. In the United States, you can call the Apple Customer Assistance Center at (800) 776-2333 to request Apple IIe Card Software version 2.2. The new software is also available on AppleLink (AppleLink path: Apple Products: Apple II: Apple II Product Information: Apple IIe Card).

INSTALLING SYSTEM 7.1 ON A MACINTOSH QUADRA 700 AND 950

To install System 7.1 on a Macintosh Quadra, use the Installer programUs Easy Install option, or choose RSystem software for any MacintoshS in the InstallerUs Customize window. If you use the Macintosh Quadra option in the Customize window, some parts of the Monitors control panel will not work correctly.

MacTCP USERS: CHECK VERSION BEFORE YOU INSTALL SYSTEM 7.1

To use MacTCP with System 7.1, you need version 1.1.1 or greater. If the version number is 1.1 or earlier, you need to remove the file from your System Folder before you install System 7.1.

IF THE SYSTEM 7.1 INSTALLATION FAILS

The installation may fail if your existing System file contains fonts with names having more than 31 characters.

If this happens, follow these steps:

1. Open the System Folder and move the System file to the desktop.
2. Restart the Macintosh using the Install disk. When the Installer opens, proceed with the installation (refer to your manual for help).

3. Restart the Macintosh when the installation is completed.
4. If you wish to use the fonts that were installed in your old System file with System 7.1, open the System file on the desktop and drag the font icons to the System Folder icon. The fonts are moved to the Fonts folder and can now be used.

If you had installed additional software that modified the System file, you will need to reinstall it after you install System 7.1.

USING ADOBE TYPE MANAGER WITH SYSTEM 7.1

In System 7.1, a new folder named RFontsS stores all screen and printer fonts. Fonts you drag to the System Folder are automatically installed in the Fonts folder. If you use Adobe Type Manager, but are not getting smooth type onscreen, you must move any PostScript printer fonts located in the Fonts folder to the Extensions folder. Please contact Adobe to obtain a new version of ATM that will allow you to use the Fonts folder (see details below).

A Gift to You from Adobe

Adobe Systems is pleased to offer Apple computer owners a free copy of award-winning Adobe Type Manager (ATM) software.

With ATM, you'll gain access to thousands of PostScript Type 1 fonts for use on screen. Plus, ATM software can be used with all Macintosh-supported printers, including the ImageWriter, StyleWriter, LaserWriter, and PostScript typesetters.

As a special bonus, you'll also receive four free typefaces from the Adobe Garamond family. These Adobe Originals are a fresh treatment of some of the most popular typefaces in history.

Take advantage of this incredible offer today! Order the latest release of ATMQplus the Adobe Garamond typefacesQand pay just a $7.50 shipping and handling charge ($30 outside the USA and Canada). Together, these products normally retail for $346!

U.S. and Canadian residents, call

1-800-521-1976 ext. 4400, or fax 1-303-792-2231

Outside the U.S. and Canada, call

(303) 799-4000 ext. 4600.

Fax requests please include name, shipping address, daytime phone and credit card information. Please allow 6-8 weeks for delivery. Outside the U.S. and Canada, you may either take advantage of this $30 offer for the English-language version of ATM shipped via courier, or see below for other offers that may be available in your country.

Message-ID: <CnExn9.C9K@noose.ecn.purdue.edu>
Source record: 276055

Well I went out and bought one of these today... Have used
it with my MVT-7100,CD,and a simple microphone/amp circuit for a
bug... It works great so far! doesn't really bleed into the scanner or
anything... I found the reciever IF at 10.7 ~ 10.8 MHZ but none at
455khz interesting...

Anyways the reason why Im posting is that Ive seen people wanting to
increase the range of this so I thought I would take a look inside...

What I found was a chip that I can't identify... I imagine its the
circuit that makes the FM stereo signal, but since I don't have the specs
I don't know...

the chip is marked JRC A2002A... Does Anyone have info on this???
I like others wanted to increase the voltage to make the transmitter
transmit farther, but without know what the JRC-A2002A accepts as
a supply voltage, I'm not going to mess with it right now.

Instead I just soldered on a longer antenna, seems to get a little
logner range....

fun little toy, definately not worht 39.95 but DEFINATELY worth 19.95

Thanks RS for once again over pricing then discontuining!!!! :-)

From: cjs9@cornell.edu
Message-ID: <cjs9.7.00076488@cornell.edu>
Source record: 276065

In reply to all of those who are trashing the 2500 I can only say that you have very short attention spans. Sure it overloads in high RF areas if you turn the squelch all the way down. Close it down and you do away with most of the front end overload. As for the intermods, quilty as charged, but I can live with it. Yes I am a railfan and yes it works great at trackside. The sensitivity and features far outweigh any shortcommings of this radio. The auto store/search feature and the hit counter are very valuable for really finding out what is in your area rather than putting everything in the book in the radio . These are imho, some real features that other manufacturers ought to take a serious look at.
I choose the 2500 over the Pro 43 for the above reasons and some others that are important to me. That is what anyone should do, look at each yourself then choose.
By the way how about some mods for this radio? Anyone out there have any. If so please email me at cjs9@cornell.edu
Thanks Carl

I've owned an R1 and had a very bad experience with enormously
wide selectivity and tremendous overloading from transmitters
that weren't all that close to me. If you're looking for a scanning
receiver with the coverage of the R1 but with very good performance
all the way around, the hot ticket these days is the Yupiteru MVT-7100.
It far out performs the R1. Even shortwave broadcast reception is
decent.

Although I risk being persecuted for saying something bad about the almighty MVT-7100, when I saw it in the store window, the first thing that struck me was how BIG it was. At the time, I was looking for something a bit more stealth-like. Am I the only person who thinks this thing is a real brick? I assume its performance outweighs its size, so people don't complain.

I use a sound activated casette recorder with c120 tapes. The advantage is that you don't record "dead" air. It makes the recording process much more efficient so depending on the channel activity, you may be able to record several days on a single tape. I purchased a Radio Shack "voice" activated recorder. It has an external mic input that works fine over a wide range of input levels. I don't know if they still sell the model I purchased.

Here is my experience so far.

I put a DX350 and the transmitter in the back window of my car
and walked away 120 feet out the back before losing the signal.
The manual says 20 foot range. Also I can here it all over the house
not only on the little receiver but also any radio receiver I try it on.
I still need to try it on my vehicle radios.

Does RS have another device available that will not be discontinued?

Or does anyone else make something like it?

This little gadget is quite a find!!!

If the Radio Shack Silent Play gizmo has good separation, you might consider connecting each channel of the transmitter to different scanners.

If you were listening on a stereo receiver with a balance control, you could choose Left or Right channel depending on which scanner you wanted to hear, or leave the Balance in the center to monitor both scanners.

The baby monitor repeaters I constructed are monaural.

2108. Re: Useful channel "banks"?

Newsgroup: rec.radio.scanner
Date: 1994-03-29 14:37:32 UTC
From: parnass@cbnewse.cb.att.com
Message-ID: <CnFKMq.HsK@cbnewse.cb.att.com>
Source record: 276064

carmean@coyote.rain.org (David Carmean) asked:

> Do there exist scanners in which one can dynamically change the
> size of the channel banks? I'd like to be able to set up
> functional groups that do not necessarily have 10, 20,
> or 40 freqs. For instance, I'd like to be able to quickly
> turn on media freqs if I hear of a newsworthy incident
> on the public-service freqs. Similarly, I'd like to be able to
> group, say, law-enforcement freqs by city, or separate city
> and county fire from state and federal resources......

The Icom R-7100 has several 100 channel banks.
You can scan one bank at a time or all banks.
Beyond that, you can associate each channel with one
of 10 categories.

For example, bank 1 (channels 0-99) could be programmed to the
police, fire, ambulance, and press frequencies for your county.

Then, you could assign the police freqs to category 1,
the fire freqs to category 2, and the press freqs to
category 3.

When you scan, you can elect to scan:

- all (locked in) channels in bank 1, or
- only the fire channels, or
- only the police channels, or
- only the media channels.

Further, you can scan all the locked in channels in all banks,
or just the media freqs in all banks, etc.

There are many possibilities. The R-7100 is a great receiver
but it scans rather slowly.

>clean, key pad lines up and no lose parts were noted. Any ideas? Thanks, as
>always.

One thing that came to mind is that the microprocessor crystal might have cracked. If it's socketed, pull it and shake it. If it rattles, replace it. You might be able to shake the whole radio and hear the same thing. Other than that, not much to offer - a lot of things can break in a 6 foot fall.

-->
--> Philips Wong, VR2XVI

Icom make a 2 meter radio, I can't remember the model, that is a 2 meter
transceiver on one side and a scanner on the other.

Other 2 meter radios, when modified, extend the rx coverage.
For example: the Yaesu FT-530 with the mod can:
receive: 110-180 300-500 800-950 MHz
transmit: 110-180 400-500 MHz

You might check out the AOR AR3000A. It has a freq range of 100kHz to
2.036 GHz with some pretty sophisticated performance specs including a
built in RS232. I believe it runs around $1200. For suppliers, try
Grove (800)438-8155 or maybe EEB (800) 368-3270.

Good luck.

```
I finally finished the Index file for the Boston ARC's hamradio
section on Oakland University's anonymous FTP site oak.oakland.edu

The file is called 00-Index.txt, and is located in the /pub/hamradio
directory.

The format of this file is:

/name of directory/
files a one-line description of each file
within
the
directory

I know this project has been long overdue, but the inclusion of the
archives on the QRZ CD-ROM was just the insentive I needed.

If you do not have direct FTP capability, and would like a copy of the
file, please let me know.

There might be something wrong with the battery pack. You'll probably have to
buy another one.

Hope this helps.

Mine was doing some weird stuff a while back, ie, it wouldn't turn on with just
the battery pack, even after the battery was fully charged. I laid out $40 for
a new pack, and it works fine.

>Anyone with any thought one this, please come in!!!!!

As with any extremes in technology, there are trade-offs. The R-1 is tiny...very tiny. This makes it a very discrete piece of equipment to carry around. Only a few years ago, one would be insane to think the average Joe could carry around such reception capability in his shirt pocket. The broad frequency coverage and sophisticated features of the R-1 are quite impressive, and it does work quite well (cellular reception and all). But... it's tiny size does extract a price in the form of selectivity during limit scan, and it's desire for an optimum antenna at HF frequencies.

You have to look at your intended application to determine if the R-1 is right for you. In my case, I needed a VERY discrete receiver that I could carry into work to listen to the Shuttle during launches here on the space coast. Military aircraft freqs were also needed. I have noticed no shortcomings in the memory scan mode. So for me the R-1 is ideal. If you don't need such discrete portability, there are other portables on the market, but most all with anywhere near the same capabilities as the R-1 will share it's trade-offs.

Good luck!

You probably mean intubate. And your right about it having to do with the airway. Basically, comes down to sticking a tube down the subjects airway to keep it open. There are several different ways to do this, but they all perform the same purpose.

2127. Re: Neat Radio Shack Gadget

Newsgroup: rec.radio.scanner
Date: 1994-03-29 19:59:48 UTC
From: mike@garfield.csuohio.edu
Message-ID: <1994Mar29.195948.19113@news.csuohio.edu>
Source record: 275934
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

Some comments on the RS Silent Play I bought, others who have
one have same experience?

1. Looking for an excuse to justify the purchase of my RS RF freq
counter I tried to lock in on the Silent Play transmitter.
Only way I could get a reading was to actually wrap the wire
xmitter antenna around the RF counter antenna a few times. Oddly,
I got an xmit freq range of 85MHz to 90Mhz. Anyone else have same
experience? Actually also touched bare end of the transmitter
antenna to the RF counter antenna (they say not to do that, but I
figured it's a weak enough transmitter, could not hurt), and got same
85-90Mhz range. But, when listening to the transmitter thru
my digital display stereo receiver, it was as advertised - 89-93Mhz.
Seemed strange.

2. Anyone know the transmitter output in milliwatts/microwatts?
Wasn't in specs.

3. The specs say the transmitter soaks up only 9 milliwatts, seems
low to me. Receiver soaks up 15 as I recall.

4. To lower battery consumption off those tiny AAA's, I removed the
red LED on the transmitter. Serves no purpose I think other than to
let you know it's on, and also to fill the hole in the plastic mold
shared by the stereo-on indicator on the same hole in the receiver
unit. No wonder it cost them so little to make.

5. When I tune the receiver part of the pair to a dead spot, then
I flip on the transmitter and tune the transmitter, I also notice
the reciever is getting tuned also! I.e, you can tune in stations
(within 88-91mhz) on the receiver unit by merely adjusting
the transmitter (and not touch the receiver). This seemed odd.
The receiver goes back to it's original dead spot if you shut
off the transmitter.

6. I think to increase range, you simply increase the length
of the antenna even integral lengths. I suppose you could calculate
1/4 and 1/2 wavelengths, and solder in your own antenna wire. Might
also be possible to rig your own small telescoping antenna to the
unit (like for a cordless phone) with some careful drilling.

7. If you wanted to construct a dipole, you would use the transmitter
wire antenna for one half. Where would you take the other half, from
the negative battery terminal?

How bout for a 5-element Yagi? (just kidding).

8. If you just run the transmitter without audio input (dead carrier) into any FM radio, you can of course hear silence. Now, flip the transmitter switch between mono and stereo. Going from stereo to mono, you hear a slight, quick, audible chirp going from a high tone to a lower one coming from the FM receiver. I suspect it has something to do with the transmitted stereo signal going from multiplexed to monoaural, and you are hearing some sort of artifact of that transition.

This little gizmo is getting a lot of attention. Anyone up for starting an alt.radio.silent-play? :-) again, just kidding.

2130. HB-232 instruction set info?

Newsgroup: rec.radio.scanner
Date: 1994-03-29 22:57:37 UTC
From: mac@cray.com
Message-ID: <mac.764978952@juniper22>
Source record: 275937

Does anybody know of, or have a description of the instruction
set defined by the COMMtronics HB-232 computer interface
for the PRO-200* radios? This would be a list of the
functions of the radio that can be controlled, like
"set memory channel to X", "load VFO with frequency Y"
and so on.

Thanks,
Mark

The FCC is finally replacing their 70's vintange computer and replacing it with a more modern PC based net. This new net will allow the FCC to begin processing the new 'vanity' US amateur radio callsigns. Perhaps the FCC will also put the database online!

2132. Why is cellular sometimes one-sided?

Newsgroup: rec.radio.scanner
Date: 1994-03-29 23:36:13 UTC
From: S Willingham <harris.swilling@ic1d.harris.com>
Message-ID: <CnG9KE.8pp@news.ess.harris.com>
Source record: 275939

My question is: How come some of the conversation heard (as you are quickly passing through the band with your hands over your ears) is only one side of the conversation? Typically, the land line side. I think the cellular side that can usually be heard is the sidetone fed back to the cellular user, but why can't you always hear it? There must be a simple explaination. Maybe I'm just thinking too hard.

Forgive me if this has been covered a zillion times before.

I recently bought an AOR3000A. The advantages are that it has a lot of features, has continuous coverage to 2 gHz, can pickup SSB, shortwave (as good as YB400), with 15 preselector filters and multiple RF frontends is extremely clean in terms of IM and images, has 400 memories, 4 programmable searchs, selectable steps, selectable delays, lockout frequencies during search as well as scan, programmable attenuator by channel. The disadvantages are that some functions require a lot of button mashing and there are only 4 banks for the 400 channel memories.

Source record: 275945

Actually the term is "intubate," and it means placing an
endotracheal tube (about a 7.0 or 8.0 mm ID PVC tube) into
the larynx through the mouth, usually with a laryngoscope,
which is essentially a metal tongue blade with a light at
the end to allow direct viewing of the vocal cords and larynx.
The purpose of the tube is to allow ventilation of the lungs
when an Ambu bag and mask either won't work (facial trauma,
inablility to keep a good mask fit to the face) and/or when
the airway must be protected from secretions, vomitus, etc.
in an unconscious or obtunded patient.

Is this more than you wanted to know?

2141. verification of Pro-37 specs needed

Newsgroup: rec.radio.scanner
Date: 1994-03-30 03:24:32 UTC
From: sita@ecf.toronto.edu
Message-ID: <CnGK4w.2Lw@ecf.toronto.edu>
Source record: 275948
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I'm looking for someone to confirm for me that the Pro-37 does indeed support the following frequencies (perhaps modified to support them?)

30.000 - 54.000
108.000 - 136.975
137.000 - 174.000
380.000 - 512.000
806.000 - 823.9375
851.1125 - 960.000 Mhz

Additionally, what would be a fair price to pay for a used (modded) Pro-37? Are there any serious drawbacks that should disuade me from this model?

Thanks for any help!

My handy file tells me this about all those Itinerant and GMRS Freqs:

ITINERANT FREQUECIES
====================
Itinerant Frequencies are used for operations which may take place
anywhere in a given state or even anywhere in the country. Portable
radios, pre-programmed or crystallized with itinerant frequencies
are now widley avaialable. Often users will not license themselves.

33.14 154.570 464.500
35.04 154.600 464.550
43.04 158.400 469.500
151.505 451.800 469.525
151.625 456.800

DOT FREQUENCIES
===============
Some land mobile radio companies mark their radios with
dots or stars to indicate what frequency the radio is
tuned to. Below is a list of common designations.
Black Dot 462.625
Blue Dot 154.570
Blue Star 467.925
Brown Dot 464.500
Gold Star 467.875
Green Dot 154.600
Orange Dot 462.675
Red Dot 151.625
Red Star 467.900
Silver Star 467.850
White Dot 462.575
Yellow Dot 464.550

GMRS FREQUENCIES
================
There are eight primary frequency pairs allocated to the GMRS: 462.550
467.550 MHz
462.575 467.575
462.600 467.600
462.625 467.625
462.650 467.650
462.675 467.675
462.700 467.700
462.725 467.725
The higher frequency is used for repeater inputs.

GMRS licensees may use any of the following seven
split channels in simplex mode with 5 watts maximum power: 462.5625 MHz
462.5875
462.6125
462.6375
462.6625
462.6875
462.7125

Hoping this works, first time posting from AOL.

Dear DX'ers:

My E-mail box has been flooded by requests and questions regarding frequencies and guides. While I would like to answer each and every one of you personally, it is physically impossible to keep up between my schooling and work. I sincerely apologize.

In answer to the most frequently asked question "Is there an all inclusive book for scanner listeners?" the answer is no. However, there is one book that comes very close. It is called MONITOR AMERICA, and it is the only book I go by. What does it include? Let me give you a brief synopsis:

MONITOR AMERICA (about $30.00 last time I checked)
published annually, the 1994 edition is obviously out!

covers: ALL 50 states and Washington D.C.
ALL MAJOR METROPOLITAN AREAS IN EACH OF THE 50 STATES

some (BUT NOT ALL) of the categories covered:

STATE POLICE COUNTY POLICE/SHERIFF'S POLICE LOCAL POLICE
CORRECTIONS STATE HIGHWAY/D.O.T. MARINE
RAILROADS AVIATION/MEDICAL-COMM-POLICE EMERGENCY MED SVCS
HOTELS/RESORTS SPORTING EVENTS/STADIUM SECURITY FEDERAL
PUBLIC TRANSIT PUBLIC WORKS/PHYSICAL PLANT CONSERVATION
FORESTRY SHOPPING CENTERS REACT NETS
BUFF NETWORKS NATIONALLY-USED FREQUENCIES MILITARY BASES
PHONE PATCHES TRUNKED PUBLIC SAFETY/DATA CHANNELS HOSPITALS
NAT'L MONUMENTS

that's off the top of my head.

MONITOR AMERICA is arranged by state, and is so good because each state section is authored by someone from the state, for the most part. Each state section also contains maps showing regional breakdowns of state police/highway patrol boundaries, as well as state D.O.T. regions. 10-codes unique to the particular state being covered are also included. Some major cities/counties have maps or written listings showing unique features to their system.

MONITOR AMERICA is available through SMB Publishing (no endorsement intended)
via VISA/M-C orders @ 800-722-6701

If you choose to write, here is their address:

SMB Publishing
Post Office Box 428
Newton Highlands, MA 02161

I can guarantee this book blows POLICE CALL and BETTY BEARCAT right out of the water IF you live near civilization in any of the states. If you live in, say, Olney, Illinois, Garnett, Kansas, or the like...stick with POLICE CALL or BETTY BEARCAT, as they give COMPLETE LISTINGS for the states via FCC printouts which allows you to find agencies particular to your county/township that will not be listed in MONITOR AMERICA.

I hope this helps to answer everyone's biggest question, and if anyone knows of a nationally-offered book that can compare with MONITOR AMERICA, please let me know so I can get my hands on it! I always want to learn more.

In addition, please limit frequency questions/requests sent to my E-mail to direct questions regarding Chicago metropolitan and the State of Illinois.

To readers of the net who have no idea why this was posted, thank you for indulging me so I may regain my sanity.

Sincerely,

****

>might be communicating with the train (or dispatcher or whatever) over the
>radio?

Lots of people interested in photographing or watching trains use scanners to monitor the railroad activity and get info on departures and arrivals. Though more detailed infor could be provided through rec.railroad or the railroad mailing list, I will try to give a few notes.

The essential book for railroad scanning is The Compendium of American Railroad Frequencies by G. Sturm & M. Landgraf, published by Kalmbach books. This book lists all railroads by state, noting the roads freq.s and what they are used for. Some maps are included. The FCC has allocated 100 channels for railroads so even without the boo you could find something. They range from 159.810 to 161.205. The book should be available through a hobby store, some book stores, through rail magazines, or direct from Kalmbach @ 1-800-533-6644.

Once you have the freqencies you can tune out the more heavily used police channels and pick up communications between road engines and dispatchers.

Again the book provides the most complete and up to date refernece, but there are faqs and people on the net who can provide you with the fine points of RR scanning, like how and why to tune in an end-of train device. As I write this more infor keeps dawning on me. There are 3 or 4 rail BBSs out there that can provide info and wuarchive.wustl.edu /graphics/trains/text should have something.

hope this helps
christos information has different uses for different people: it all depends on what your goal is pathiakis

2151. Quick reference guide for 2006?

Newsgroup: rec.radio.scanner

|> - exactly what is this thing
|> - how much are they
|> - where do I get one
|>
|> Thanks for any info.
|>

The Alinco DJ-580T is a dual band (2M/440) handheld tranceiver (HT) with wideband receive and transmit capabilities. As shipped, it will receive amateur, air and some public service. After a simple mod, it will receive 108-174, 400-487 and 860-999 Mhz. After another simple mod, it will transmit from about 130-165, 420-475 or so. IT WILL NOT XMIT ON THE 800 MHZ BAND SO IT WILL NOT 'TRANSMIT CELLULAR'. The ham in question was most likely utilizing a phone patch on a ham repeater - which most any modern HT can do. You must have an amateur license of technician or higher to transmit with such a radio. The test for no-code technician is very easy...

The DJ-580T is a very good HT - I owned one, but sold it reluctantly. It is available from any ham radio dealer. The going price is $360 to $400 depending on sales, coupons, rebates, etc.

2154. Power supply for scanner?

Newsgroup: rec.radio.scanner
Date: 1994-03-30 15:47:44 UTC
From: dhughes@prairienet.org
Message-ID: <2nc6v0$fgp@vixen.cso.uiuc.edu>
Source record: 275963

I have just purchased a Uniden handheld 55XLT scanner. The manual says to use the Uniden AD1004 power supply with this unit, because other power supplies may overcharge the nicads.

Can someone please give me the specs of this power supply? Am I wrong in thinking that most any 7.5V power supply will do a good job, and the Uniden folks are just trying to push their own product line?

Besides the points that Brett mentioned, if the manufacturers were to use an encryption system on the data, then you'd have another potentially *big* hurdle.

2156. Railroad scanning

Newsgroup: rec.radio.scanner
Date: 1994-03-30 16:11:00 UTC
From: gregory.halpin@bitbytes.clark.net
Message-ID: <e5.2712.143.0NE0A2D3@bitbytes.clark.net>
Source record: 275961

Greg Youngdahl asked:

G> Any Railroad scanning buffs out there? I'm interested in using
>my scanner to hear whatever activity might be available and am looking
>for tips to this end. I live in Batavia, IL and have heard some stuff
>from the Eola Yards in Aurora (I think they are Burlington Northern
>yards). These have been mostly track maintenance types of transmissions.
>What other types of things might be heard from a switching yard?

G>trains are running through Batavia, but so far am unsuccessful. While of
>course I may not be scanning the relevant frequencies, I'm wondering if
>they are even on the radio as they come through town. What types of
>transmissions might one expect from such a train, and how frequently would
>they be transmitting? Are there any types of signaling equipment that
>might be communicating with the train (or dispatcher or whatever) over the
>radio?

Well, Greg, I monitor rail frequencies, and am a railfan.

Yard comms will depend on what services occur in that yard. In my town, we have a small Conrail yard that is basically at the end of a secondary track (It doesn't go anywhere but here). So comms from there are limited. Basically switching, making up trains, and communicating with the dispatcher for clearance to occupy the "York Secondary" and eventually to enter the "Port Road".

When Enola Yard was in full operation (was scaled back several months ago) comms included "hump" operations, engine servicing, crew changes, trains getting clearance to enter, depart, and pass through the yard, etc.

When monitoring Conrail in other local areas, you can hear track inspectors, trains getting cleared to occupy "blocks", maintenance crews, Conrail Police, and two other items of interest.

One is a "defect detector" or "dragging equipment detector", which are placed along main lines to electronically inspect passing trains for problems. It consists of an automated message similar to this: "Conrail, Marietta, Pennsylvania, Milepost 34.7, track 2, no defects, axle count 244, end transmission". This will then be reported to the dispatcher by the train crew. These detectors are low power, so you'll probably only hear a few local ones. They are good for an advance warning of an approaching train.

The other is a FRED (flashing red end device) or EOT (end of train) device, which is the little blinking light that replaced cabooses on the end of trains. They broadcast on a distinct frequency, and send data to

the crew at the front of the train. This you can monitor just to know there is a train in your area, but I know of no way to translate the data transmitted.

Another source of frequencies is a book, title The Compendium of American Rail Road Frequencies or something to that effect. Check train or scanner publications for the book, or possibly a local book store.

I bought the silent play gadget yesterday (out of curiosity more than anything else).

what is the VOL on the transmitter for ? I assume LO is low power and HI is high power.

should I adjust the volume of my source until it starts to overmodulate and distort the signal then back off a bit, or should I adjust the volume to the lowest the gadget can handle ? I know the book says tune the volume halfway. I am asking this mainly from the standpoint of saving batteries on the transmitter, but other ideas are welcome.

The Silent-Play devices sounds like it would lend itself to being placed in a bag with a scanner.

You can then use one of those headphone only FM receivers to walk around and listen to your scanner. Somewhat inconspicuous compared to having your scanner on your belt.

> be holding the device when this happens!
>
> The signal is 1W, VHF-FM, transmit only. Old ones had a single channel,
> newer ones can select one of 99 channels (synthesized).

I just got back from a long trip to Dallas for a job interview, so
I haven't had any time to play with the sonobuoys yet (they've been
safely sitting under my bed the whole time). I knew the two pins on
the bottom of the buoy had something to do with activating it, but I
was thinking they might be pressure activated (hitting the water and
all) but the salt-water shorting makes a lot more sense - I'll be
careful to make sure they don't get shorted!
I don't seem to see any channel setting switch on the outsides.
On the small one, there is a switch that sets the life from 1 to 3
hours, and the larger one has something that seems similar, with
settings at 1, 3, and 8. On both of them, the number 4 is printed in
large font around the center of the cylinder and on their bottoms.
Here are some other distinguishing numbers:

Small buoy: Large buoy:

Side: Side:
AN/SSQ-41A AN/SSQ-57A
37695 DVK 26479 N00163-78-C-0037
N00019-71-C-0544 LOT 1 37695
LOT 34 <- ROTATE ->
TO
SET DEPTH
300 60
FEET

Bottom: Bottom:
SSQ 4 LAU-111/A
41A N000163-78-C-0037
Depth Selector MFG. NO. 37695 LOT NO. 01
Press to turn
60<->300

I would like to eventually set these up as a 2m FM rig for packet so I can free up my HT for other uses (1W is more than adequate for me here). I understand these sonobuoys only have TX units in them, so if any recommendations can be made on how I can get an RX unit for 2m or convert one of the buoy's TX units to an RX unit, I would appreciate it. Any advice at all on how to go about converting these radios to 2m use would be greatly appreciated.

This is from InfoWorld:

InfoWorld, March 21, 1994 (page 39)

Help Desk / Brett Glass

"There is no law against using a notebook PC on an airplane"

Q: On a recent airplane flight, I found myself unable to complete an important spreadsheet because the flight attendant said that using my computer was against the law. What law is this, and when did it take effect?
Hal Levy

A: Airline restrictions on laptop computers have existed for about a year, after sketchy, unverified reports that one or two aircraft had experienced odd navigation problems. Unwilling to recognize much more likely causes - such as inadequate maintenance or cockpit error some airlines targeted a convenient scapegoat: personal computers. I had firsthand experience with this situation last week, when my Continental flight was delayed for a half-hour at the gate. Horrified crew members saw me using my laptop and insisted that I turn it off during the wait, claiming that it was against a recently passed law to use it. They made the same request a full 20 minutes before landing. As a result, I lost more than an hour of valuable work time.

Once safely on the ground, I called the Federal Aviation Administration to ask for copies of the relevant laws and regulations. According to an FAA representative, the panicky crews on both our flights were incorrect; no new law has been passed banning the use of computers on airplanes. 'Me regulation that does apply, Federal Aviation Regulations Section 19.21, says only that the operator of an airplane can, at his or her discretion, ban some devices if he or she "determines" that they will interfere with the plane's electronics. This vague rule does not mention how such a "determination" should be made, so some carriers - with no scientific evidence to back them up - have tried to use it as justification for arbitrary bans on laptops. Worse still, the airlines' rules are often over-zealously enforced. The technophobic crew on my flight, for example, went far beyond the airline's printed policy, which restricts laptops only during takeoff and landing.

To be fair, a few devices - such as two-way radios - might create enough radio noise to be a problem. But in banning laptop computers, airlines ignore the fact that another government agency the Federal Communications Commission - requires that laptops pass stringent emissions tests before they may be sold in the United States. They also ignore the emissions-reducing effects of modern battery-saving circuitry and the powerful shielding provided by the airplane's metal skin. FAA representatives say that no incidents of interference from laptops have ever been verified. And two highly knowledgeable technical groups, the Radio Technical Committee for Aeronautics and the Electronic Industries Association, have dismissed bans on laptops as unnecessary.

Some industry watchers, such as syndicated consumer columnist Peter S. Greenberg, see the restrictions as paving the way for a future in which airlines force passengers to use only airline-provided entertainment and computing devices - and turn a hefty profit by doing so. Whether or not this theory is correct, we as consumers have the power to bring the airlines to their senses. Because the regulations give carriers wide discretion to set policies, we can keep Luddites (and, possibly, profiteers) at bay by voting with our wallets. If an airline insists on blaming mishaps on business travelers' vital tools, it's probably time to find another airline.

Brett Glass' Help Desk answers business computing questions. Readers can leave queries by calling (800) 227-8365, Ext. 702, or by messaging CompuServe (72267,3673).

>Branson, Missouri areas.

Hi Bill,
You may get some responses with the normal/common type
frequencies...I'll give you them if you want.
BUT here's the BASS PRO SHOP frequencies you'll not find
in too many directories, they are from the 1991 FCC 'fiche,
and are not verified: Bass Pro @ Ozark, Mo: 461.575, 463.6
Bass Pro @ Springfld: 463.8875, 464.6
If you have Compu$erve access, I have uploaded a file
called KCFRQ.TXT in the scanner section. If you don't, let
me know, and I'll try to get it to you.
General Mo Freq's: Mo Hiway Patrol: 42.06, 42.12, 42.22, 42.32, 42.38
Common Sheriff Freq: 155.73
Mo "Point to Point (Intersystem): 155.37
and of course Mutual aid 155.475, but the other 2 are more active.
The KCFRQ.txt file has about 900 listings so I'll not
post it here!

What about the IC-2SRA...is there a keyboard sequence that will open up the TX side? Also, I wish they'd have provided a stereo earphone jack, with each receiver having its own channel. It'd make it a lot easier to listen to both.

Even in my small-city area (Santa Barbara, CA) with the stock antenna I find the scanner selectivity marginal...I have to lock out the ambulance dispatch freq (472.975) due to overload from a pager system. But it has *continuous* coverage from 25-950MHz, AM, FM, WFM (I can't remember if it came that way or I had to trick it).

In Santa Barbara, CA, the PD uses "code 40." Fire and EMS do use ETOH.
If the subject/pt. is intoxicated by drugs other than alcohol, "UI"
(under influence) is used.

No - to open up the transmit side of the 2SRA you need to do some hardware
mods...

|>
|> Even in my small-city area (Santa Barbara, CA) with the stock antenna I

|> came that way or I had to trick it).

The 2SRA comes that way. There is a key sequence to allow you
to tune 130-174 on the 2M side. It will actually display 100-500 but won't
receive anything outside 130-174 or so. And - before some newbie suggests
that such a keyboard mod will open it up to intermod - it only allows the
CPU to program those frequencies. The RF sections are already as intermod
prone as they will get...

I know several people have requested this in the past few weeks, but I'm going to do it again.

I've got a Pro-43 with the 800 mHz restore already performed. I know there is a mod to diminish the 'beep', and I know there are several other mods for various filters and s-meters. But are there any other *cool* mods to be done? Like increasing the scan speed, or adding more banks of memory? I was afraid that these questions were answered in e-mail, and I never saw the answers.

Thanks!

Oh yeah, the 55-88 restore is also complete on mine.

What is the frequency of the Cell Carrier Audio tone?

I found some sample IC's that TI makes that have an built in low pass filter and amplifier. The filter in my sample is 5 kHz. I think they (we) make them in in 3,5,7 kHz versions. The other nice thing is that they have a power down feature that might make a battery powered filter practical for earphone listening. A some-day-project for me.

If someone is interested, I can go find them in my shack and give out the part number.

NO, I don't work for that part of TI. However, if you want some to buy a HARM Anti-Radar missile I could tell you who to call (grin).

I've left the Cellular stuf in for the record in case some
one wants is......Joe

This file is meant to replace the old PRO-43 mod file. 1/26/94

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out
you should not remove but MOVE the diode. Doing so allows cellular coverage as
well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them.
They are selling the PRO-43 for $300 which is $50 less than Radio Shack.
I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone
conversations.

The following procedure requires familiarity with microcircuit soldering and
will violate your warranty. Grove Enterprises assumes no liability resulting
from its attempt, nor will accept the modified scanner for return under any
condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a
desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips
screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

==========

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).
3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

---

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

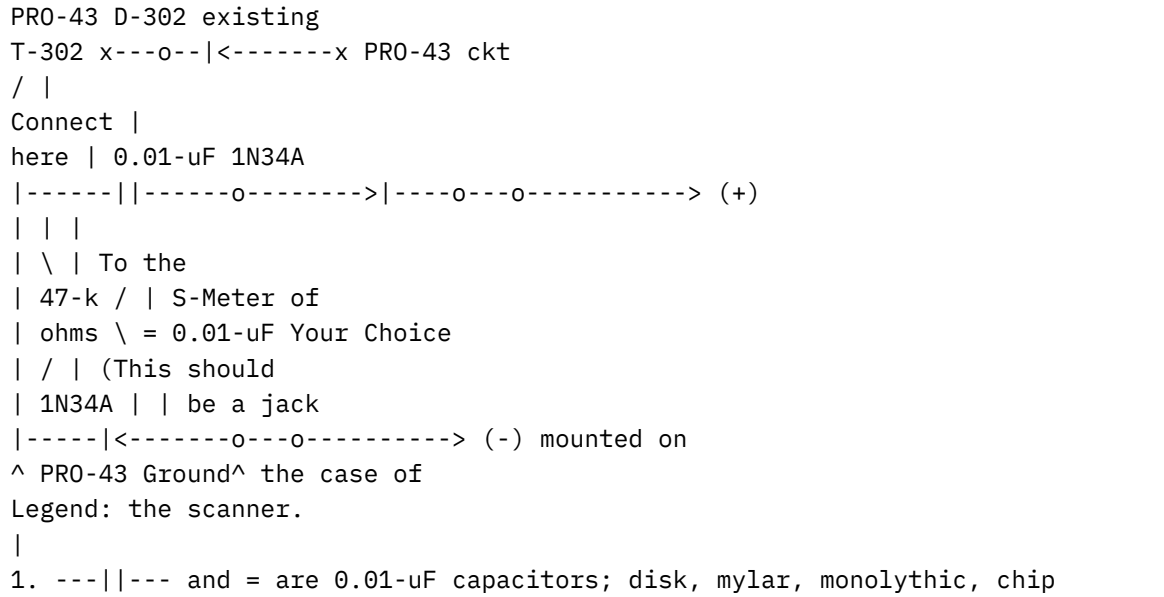
Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the PRO-43! Only a simple circuit and your choice of meter, analog or LED, is required for a jim-dandy S-Meter function!

The key point in the circuit is the cathode of D-302 located on the bottom (solder side) of the AF Board (middle board). You will need the Service Manual for the PRO-43 to find it as it's not marked and it would take me 10,000 words to guide you to exactly where it is located. Call Tandy National Parts at (800) 442-2425 to order your manual: approx $10. Now here is the deal:

Locate D-302 and either build the following circuit right there on the back of the AF board in the vicinity of D-302, or solder a wire to the cathode of D-302 and route it to somewhere else more convenient to feed the below circuit. This wire ought not to be very long, though, say not more than a couple of inches. Refer to the ASCII schematic diagram as follows:



5. -------- and | are wires/conductors.
|
|

6. x is existing PRO-43 circuitry

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:

```
5-k Trim Pot
(+) --------/\/\/\/\---o--------|
| | |
This should |-------| |
be a plug of +
some sort to The S-Meter
connect to the Terminals
mating jack on -
the scanner |
|
(-)----------------------------|
```

You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Source record: 275980

These are all very good suggestions, but what if you have
one channel (let's say a cordless phone that is very close)
(maybe even within the same house)
and I want to scan all the channels in that bank without
having to continually hit the scan button to go over that
channel if nothing is being transmitted.

I'm not saying that I listen to cordless channels, this
is just a hypothetical question! Listening and recording cordless
channels is illegal, and I never do that.

Probably the only way, is to not receive that channel.

>I have seen ads in MT for a 46 MHz full wave or half wave dipole wire and
>thought that I could string my own wire from the bolt on the top of the discone
>where the vertical element would be attached.

I added an FM mast to the bolt on top of my RS dipole, and it made a BIG
difference in the 30-50 mhz range. The bolt unfortunately was one size smaller
than the bottom thread on the mast, but a little wrapped solder made it snug.
BTW, is there such a thing as an adapter ring to connect them without the
solder wrap that anyone knows of?

Quite a large range of frequencies in toronto and Windsor! If you can be a little more specific, I can help out. The best advice I can give is to go out and pick up a copy of the Haruteq Scanner Book by Bart Veerman. It's a VERY comprehensive listing of fr
equencies for the whole province, listed by city AND by frequency. You should find it at a local Radio Shack, or they can likely direct you to a copy elsewhere.

Does anyone know where I can purchace an inexpensive (~$50 or less) DTMF Decoder? Does anyone have one that they want to sell?

Thanx

2184. Re: Pro43 vs 2500xlt???

Newsgroup: rec.radio.scanner
Date: 1994-03-31 02:02:58 UTC
From: clinehe@cherokee3.rtsg.mot.com
Message-ID: <2ndb0i$ggo@delphinium.cig.mot.com>
Source record: 275986

I'm very happy my Pro-43 but I too have found it to receive extraneous signals in highly active RF environments, like along the Expressway's of Chicago. In my case listening to a particular Chicago PD freq around 470 MHz was replaced with what sounded like cellular phone traffic. Is it an image response problem? But generally I have few problems.

Harry

2185. modify 34 and now I can't get 30-50.

Newsgroup: rec.radio.scanner

This week on Spectrum we will feature those Mexican boarder blaster radio stations. Our guest is Mike Venditti. Mike was one of the guiding forces behind station XERF and has a unique perspective on the south of the boarder radio scene.

Next week Spectrum will feature a look at TV/FM dxing with Joe Eisenberg. Joe is an expert at chasing the troppo and E skip. He will be bringing his bag of classic airchecks with him. Don't forget to tune in on April 9'th.

Saturday April 16'th Spectrum will look at the world of weather satellite monitoring and weather fax.

We will do our listener appreciation day on April 23'rd with answers to your paper mail, e-mail and phone calls.

Don't forget April 30'th Spectrum will be broadcasting live from the Dayton hamfest. Larry Steal and I will be on the scene giving you the total Dayton report.
--
Spectrum airs live Sunday at 0300 UTC (2200 EST Saturday) on:

WWCR, 5810 KHz, Nashville, TN (World Wide)
WIFI, 1460 AM, Philadelphia, PA (Philadelphia Area)
KHNC, 1360 AM, Denver, CO (Denver Area)
Omega Radio Network, Galaxy III, X17, 5.8 MHz WIDE audio. (Satellite)

Spectrum is rebroadcast:

Sunday at 1500 EST, on WIFI, 1460 AM, Philadelphia, PA (Philadelphia Area)
Monday at 0400 UTC (2300 EST Sunday),
on WWCR, 7435 KHz, Nashville, TN (World Wide)

Last-modified: $Date: 1994/01/02 22:00 $
Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

Heck of a deal. Now my FM signal generator can go back to
being a test instrument and I can stop worrying about the FCC. :^)

A Startek ATH-30 counter can't lock the transmitter frequency
(but then again, it's pretty deaf) and I don't have the right
module for the power meter, but comparing the Silent Play's
signal strength to my signal generator feeding a 40" whip are
about the same when the generator is at about -20dBm. Very
crude measurement yes, but the Silent Play tx is much stronger
than I would have imagined with all the "legal FM is a nanowatt"
talk around the net.

The stereo transmitter, a fair or better FM radio, ear buds,
and two adaptors (1/8" male <stereo> to RCA, 1/8" male stereo
to 1/8" male stereo) for $20 and change.

Now I can stop looking at those hanging packs of Ramsey FM
transmitter (kits!) every time I go to a ham fest.

As for stereo separation, I'm sitting here listening to the
BBC in one ear and the local fire freqs in my other ear. Sounds
fine. Looks like a custom three position head-phone switch
box is in order (e.g. left & right normal, all left, all right).

Now to dig up a 3 volt wall wart which is even "close" to 3 V
at low loads.

Thanks Jim (Jim Kearman), 'ya did good!

There is a device which plugs into the earphone jack of
a scanner. The other end of the device has two plugs,
one for the microphone of a cassette recorder, the other
for the on/off control of the the cassette recorder.

The result is that when you come home, you can play the tape
and get the recorded transmissions without the long
pauses and silent spots between them.

Anybody know where I can get such a thing ?

2193. Re: Tape Recorder

Newsgroup: rec.radio.scanner

I always had this idea: take a cheap sony Voice Activated (VOX) tape recorder, just set the delay to low, take a normal audio cable 3/8-3/8, plug it from the speaker of the scanner to the mic of the micro, and voila! A voice activated tape recorder that records all your favorite police or whoever! Just a thought...

If you have a USR Courier modem then you have one already! I don't know
if all USR modems have that built-in but mine does. All I do is:

ATH1
AT%T

And any tones I play into the phone/modem get displayed on-screen. I can
even get the ABCD tones and #,*.

From: henryb1275@aol.com
Message-ID: <2nebsh$fq5@search01.news.aol.com>
Source record: 276000

In article <CKEItt.B3z@umassd.edu>, rflood@cis.umassd.edu (Richard M. Flood) writes:

Can a pre-cable tv antenna be used for a PRO-43 antenna?

Sure, but its probably horizontally polarized. You may want to remount it vertically and add a TV balun so you can use coax cable, then point it towards the area which contains the signals you most wish to hear. Some TV antennas make great scanner antennas. Take all the usual power and lightning precautions, however.

2199. SW Radio Reviews

Newsgroup: rec.radio.scanner
Date: 1994-03-31 12:54:09 UTC
From: jlloyd@pluto.cs.clemson.edu
Message-ID: <2neh5h$7vh@hubcap.clemson.edu>

---

Below is a collection of SW receiver reviews written by readers of Rec.radio.shortwave. The number following the brand and model number is the number of readers, who indicated they use this type of receiver.

All credit for these reviews should be given to the readers of this group and not me.

John Lloyd

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but
are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year
now and am really pretty happy with it.

Advantages: Size - Measuring approximately
4 3/4 x 2 5/8 x 1, you can take this little
mini anywhere! Even slip it into your shirt
pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m,
25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals,
no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The
SW sensitivity is quite good for my area of the
country, Cleveland, Ohio. The speaker has a nice sound
and improves thru the earphones. FM stereo thru
headphones is great! MW DXing is surprisingly
good! I can grab signals from Boston, Chicago,
New York and Cincinnati much better than on my
Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun
to fiddle with or take for travel when you're in
a pinch. Radio Shack has discontinued this model
so you might be able to find it on sale for around
$50.00. I love the size! Ideal for travel! I'm
beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in
the front or side pocket of an average sized backpack. It is just great
when you are walking back home from school/work ... it can be easily
carried in one hand as you catch up on the news from
BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on
occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep
with music... the FM sound is pretty good in stereo (headphones)... The
AM reception is also fairly good but it has a very high tendency to catch
those Bible bashing stations...probably a reflection of the region where
I live...

The strap is a little shoddy and I have a feeling I may have to `fix it'
soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify
this. I bought it on sale from Radio Shack for the
bargain price of $129.95! It regularly retails for
$179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380
is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING
*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even
better! I read another review that said reception was lousy....I think
that individual should check his particular receiver as he might have
the rare defective unit. MW reception is also outstanding and with a
Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up
Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the
select-a-tenna! With the S-A-T reception gets an added boost!
(these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like
something smaller, like the 606. This size, however is fine. I've
carried hardbound books on jets that are larger. The many features
makes up for it's slightly larger size over a mini. It does not have
SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought
it for the price of $179.95. There are other radios in that price
range that ive ya more bang for the buck. At $130.00, it's a great
deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some
of my experiences. First of all, I would pay the extra to get the
390 to get the single side band capability. I miss it. I miss
it. Also, the sensitivity for foreign broadcasts (I'm in DC)
without an external antenna is poor. You get the BBC and some
German broadcast relays from Canada transmitters, some south
american stuff, and that's it. BUT with a 50 m Cu wire out my
2nd story window attached to the antenna with an alligator clip,

I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells) They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which

improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it. I miss the 512 memories of 700 and 'SSB clarify' control sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However, it is rather simple to make it work similarly to '700 and '2010, because the detector chip is the same in all three. Only a switch with two pairs of contacts is needed. Another design fault, the excessive distortion in SSB mode, can be partly cured by adding two resistors. For serious DX-ers it may be important that the internal ferrite rod cannot be disabled on MW and LW in both 500 and 700, so the in-house noise may become a problem on these bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise. Similar number of cubic inches as the Sony (different shape), but offering some features of the R8. Also the Lowe is made with a mostly solid alumnum case, which is better than the Sony or the Drake. The Lowe has dual antenna inputs (wire or SO-239), record out, audio out, 12vDC in. It can run off any 12V DC battery. I use 7 aH gelcells which I recharge. The Lowe also takes 8 internal AA nicads *OR* disposable batteries. It will recharge the nicads with a builtin recharger if you plug it into an external power supply. It's a nice semi-portable radio. It has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with it. I use it mainly for broadcast listening. It's connected to 25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial and the coax, and on some frequencies it gave a (small) improvement in signal strength, but it was such a pain to keep retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to offer the best of both worlds - improved matching between the wire and the coax, but no retuning necessary. It's rather expensive, though, and it may be that I'd have been just as well off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be
without it. It quite often makes a heavily fading signal quite
pleasant to listen to. Pity it doesn't have a selectable
sideband option, though - I quite often find myself tuning an AM
signal in the LSB or USB modes to try to get rid of an adjacent
interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted
a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW
and FM at home and while travelling. I like this very small radio
a lot. It is maybe expensive for a portable, but the build
quality is very good, - everything looks and feels right.
Battery life is good, and the set DOES work with NiCads (2*AA)
contrary to the instructions. Reception of broadcast SW is good,
either with the whip or clothes-line antenna. I've never noticed
any big problems from adjacent channels either. As a bonus, FM
stereo reception is good through headphones. Audio quality from
the in-built speaker is fair, but you'll want to use phones for
noisy environments. The only bug with this radio is the memory
capacity - only 10 mems is really not enough to cover ALL of AM
and FM.
Summary - if you want a very small portable, and appreciate high
quality (and can afford it), I would recommend the SW1E. Note the
E, which denotes the SW1 kit without the active antenna and brief
case - these add a lot to the price, and I don't rate the antenna
too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you
should give in to the occasional impulse, just so they keep coming).
Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65
17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position
SW band selector. FM/MW/SW select buttons double as "on" switches.
"Off" button. "Hold" button to disable "on" (prevents accidental

turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening

conditions when tweeking the radio. Even the presence of
headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on
the shortwave bands. If you're far enough away from FM and TV
stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the
convenience of the presets and the reception flexibility provided
by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my
"carrying around the house rig." It was purchased to replace a
Sony 7601 that now resides on my desk at college (things
electronic can grow legs on a college campus). By far the best
features of this unit are its convenient size and excellent
performance on all bands, AM, SW and FM stereo. Don't get me
wrong -- this is not a DX machine on SW but for listening to the
major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW
is in 1 kHz intervals. This at least gives you a "fighting chance" to
move away from interference. That's a major improvement over the
5 kHz that many radios in this price range allow. In addition, the
dual conversion design on SW keeps image interference at bay - a
major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit
clumsy. However, by entering the middle frequency of each of the
major SW bands in the 7 memories (5 memories plus 2 timer
memories) and slewing up or down from those positions you can
get around reasonability fast. The SW bands are changed by a
combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be
lulled to sleep and the timer alarm can make sure that you get to
work on time (radio shuts down after 2 hours if it is turned on by the
timer). Setting the radio alarm is very easy - once you have set the
clock, but that frankly, is a pain. The clock function, which works
very well (combination world/home time), takes at least 7 distinct
steps to set it. Fortunately the clock is fairly accurate (looses about
0.2 sec/day) so you don't have to reset it very often. The lighted
dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World
Band Radio (see below). The radio has a battery "gauge" that is
activated at the touch of a button radio and shows in the display
as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline.
It disappears after about 5 seconds. As soon as the number of
dots reaches 0, the radio shuts off immediately. I ran a a series of

tests with Radio Shacks Super Alkaline batteries and got the
following results: 3 dots showed for 37 hours, then 2 dots showed
for an additional 11 hours, and finally 1 dot showed for 3.0 hours
for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the
volume control set at 1/2 volume most of the time). At $2.89 (plus
5% for tax) for a package of four AA batteries (the radio takes 3),
that figures out to 4.5 cents/hour which is excellent. This figure differs
greatly from that given in the 1994 Passport (25-30 cents/hour). I have
no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-
scanning, forget it; it will drive you crazy. But at about $140.00 plus
shipping (NYC mail-order) it's an excellent "second" radio to carry
around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I
ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it
exclusively at home, moving it from room to room. It really is
too large for travel

I've found the sensitivity to be tremendous on SW, MW
and FM! Very rarely do I need to attach a clothsline
antenna! It has continuous SW coverage, a great sounding
speaker, BASS and Treble controls, two bandwidths, great
sensitivity, good spurious signal rejection...It has
all the features I wanted in a starter radio! I bought
it about three years ago on sale for $150.00! I still
don't know why Radio Shack discontinued it. If you're
looking for a good starter shortwave radio and can still
find one laying about at a Radio Shack store priced to move,
GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee
and I did not know if I would like the hobby or the radio. Good
points: direct-entry tuning, 36 station memories, fairly small so
it is easy to travel with, speaker sound was good, reception was
okay, but improved dramatically with the addition of the Radio
Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning
steps, only major broadcast bands tunable (large gaps between
bands), selectivity not so good, no fine tuning, no BFO, no SSB
or CW, poor FM reception. All in all, not a bad radio of $69.90,
however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers.
I have recently bought a DAK Model DMR-3000, for just

$69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.
Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good

points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All in all, this radio gave me the best price/features/size ratio of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I purchased this little radio. Sure, it's not top shelf, but it's suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments. No tuning knob but the slew tuning buttons work just fine. It's about the size of a paperback book and can be taken anywhere reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major broadcasters exceptionally well. Example: the 41 meter band is covered from 7100 to 7300. So if you want to listen to the BBC on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European signals during the day that I cangrab when I attach a long wire.

The 3625 can't tune these freqs. but it can grab 15400 (from africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average selectivity. Covers MW (in 10 kHz steps only), FM (no stereo), and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-in timer/clock (12 hour format only), 5 programmable memory locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers MW, FM (stereo through headphones), and SW in 8 bands (roughly split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and 60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic window for the digital display, which the factory replaced. It is an extremely sensitive receiver. I installed the FM detector board option, which is highly useful for Sub-Carrier detection from FM broadcast receivers in conjuction with the R70's ability to tune below 100khz without a frequency convertor. The so-called PassBand Tuning (PBT), in actuality an asymmetrical bandwidth narrowing control, is very mediocre with the factory 455khz filters. Replacing the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole crystal filter (equivolent to the ICOM FL-44) makes the passband filter work as one would want. The AM 455Khz ceramic filter is junk, and was replaced with a higher quality "4Khz" ceramic filter from the long-defunct Radio Plus firm. The actual specs for the 4Khz filter indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth, causing a slight degredation of the "highs" (The original spec is

for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

****
YORX AM908 - 1

****
Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than
the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product
detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's
low-pass audio filter, giving better bass response than normal SSB mode on
the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option
board; both can coexist. Installation is somewhat difficult, as it involves
connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This
installs fairly easily in place of the narrow CW filter. It is very much
better than the stock ICOM 6 kHz bandwidth, which is wide-open until it
hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter.
They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard
synchronous detector for the R71 as well as other receivers. The Kiwa MAP

unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual,
which details mods like enabling the preamp on MW, true pass-band tuning,
sub-10 Hz RIT, etc.

Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to
put it in here.The TS-450S iaN amateur transciever that costs little more than
a R-5000,and if you have your ham ticket or are thinking about getting it,may
be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is producewhen a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can
swing the 450's sister model the TS690,you can recieve all the way to 60 mhz.
When the 5000 is put out to pasture,if it's replacement is the 450 without the
transmitter,it will be very tough competition for the other makes.All it needs
is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive you bonkers if you have good hearing and a speaker that can put out the highs. I have had two of these,the first I traded for a sateite setup,and the one I have now.The newer reciever has mucbetter audio then the first one and lesess hiss too.Ergonomics are very good MUCH,MUCH better than the Drake R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh well,back to the 525,if you are into AM,it's probably not the reciever for you, but in allthe other modes,it is one of the best consumer grade recievers ever made.Performance in all modes is basically excellent except fothe audio pr problem,and stability is rock solid.JRC has only cut a few corners compared to the 515,probably the ultimate in construction for consumer recievers. The case is made of very thin sheet metal and the front panel is plastic.The keys fit loose in the keypad but work ok.The display has four brightness levels and is very easily read from across the room.The S-Meter is "digital" and is a floating vertical bar segment that seems to be yellow on some samples, and green on some others.It is sort of "spastic"and twitched a lot on the first one I had,but not as much on the seconone.The first 525 I had would "click" on strong AM signals,but the new one doesn't.The main tuning knob spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!) All in all, a great reciever.

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the Sony ICF-SW33 and the Sony 7601). This rig is an extremely sophisticated piece of equipment. I especially like the fact that you can store up to 125 frequencies on 25 electronic pages that can be named as you wish (by country). Once programed this is very convenient. The two filter selections are well chosen (much better than the stock Sony 2010 filters). My use the radio to copy WEFAX with excellent results attests to its stability (and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow automatic recording with certain tape recorders (Sony and others) of up to five times and frequencies in a 24 hour period. I use this feature all of the time. Audio (stereo on FM) qualitity for a portable is very good; better I believe than the stock 2010 although as with the 2010, it is improved with a set of external speakers.

Unlike the 2010, the SW55 does not have synchronous detection. That's too bad because I believe that if it had this feature it would blow away
tition. As it stands it is an excellent radio. Most interference can be eliminated with the narrow filter or moving away from the interference a bit (the radio is tunable in steps of 0.1 kHz) so the lack of sd is not critical. I really believe that Sony did not include it because it would have then had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now that I've said that, you should know that I am new to all of this "DX-ing" (is that how you say it?). However, I can tell you that it's reception with the built-in antenna and with the included auxiliary antenna is very good. I found that the radio comes pre-programmed with a number of stations (BBC, Radio Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high quality, delivering plenty of volume and good sound. There are several "tone" switches (news vs. music setting, etc.) that enhance the reception and its sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to other radios since I didn't comparison shop). There are several output jacks that make it easy to connect to external speakers, tape recorders, headphones, etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

I am guessing that you removed the diode from D11 and moved it to D9.
If you want to open up the 800MHz band but keep your 30-50MHz coverage,
remove D11 and do not put anything in D9. In your case, if you did
put that diode in D9 open your radio back up and snip that D9 diode.

Hope this helps.
Mark

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- it will soon be illegal for companies to sell scanners which cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have recently enacted laws against listening to cordless phones, but it's currently legal to listen in most states. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you

get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and

ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Service Merchandise and Circuit City sell scanners, but carry just a few models. Department stores, like Sears and Montgomery Wards, sometimes offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymack Distributing (Katy, TX) sells Radio Shack scanners at discount. Telephone (713)392-0747.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117) |

KD4MOJ maintains a scanner modification server for people | without FTP access. You can request a list of scanner | modifications by sending electronic mail with the words GET | INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immedi-

ate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,

Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1994. All meetings will be held on Saturdays at the Destiny Restaurant, 1440 Rand Road, Des Plaines, IL:

February 19
April 16
June 18
August 13
October 15
December 10

Bring a notebook and your appetite.

That's not ignorance, it's SOP. See how good you feel about your purchase,
even though you got the display unit? It works!

The periodic reminder posting for World is still floating around, but shouldn't be.

This is being looked into.

Anyway, please ignore it. The correct location of the files is oak.oakland.edu:/pub/hamradio

The World posting will hopefully be killed off soon.

Sorry for any inconvenience this may cause.

Scott

Gee this sounds alot like my 100XLT bearcat has been doing for sometime. It bugs the hell out of me. I push a key and the scanner drops power !! Turning it on and off will sometimes restore power but not always, also bumping it seems to cause power to be restored. I would hate to spend $40 on a new battery and find out I still had the same problem.

|>

If by unlocking, you are talking about mods to extend coverage - it is not illegal although there are those that will argue this till they're blue in the face. They are available on hundreds of FTP sites. The mods are typically not key sequences - they normally involve hardware mods. There are no such mods for the 404. I have not seen mods for the 41 or 44. If they do not have 800 Mhz coverage, then there is little chance of there being any kind of mod. Most scanner range mods restore cellular, but you have to have 800 Mhz circuitry first...

I bought a few of these Silent Play gizmos - I guess just the parts and fun are worth $20 a pop. I was wondering if instead of using FM Broadcast Band or a Baby Monitor to broadcast, has anyone used a cordless phone itself to re-broadcast a scanner (or whatever) output? Seems like an old cordless phone transmitter might be very good for wandering around the house, but of course any neighboor with a scanner could intercept your interceptions!
An ideal setup would be: hook a cordless xmitter up to the Pro 2006 and set it to scan certain banks, then wear the pro 43 on your belt and tune it to the output of the cordless xmitter, and set the Priority on the Pro 43 to yet another critical frequency and this would interrupt the 49 MHz link as necessary. Of course I think Bob P. posted this idea a few years back using an old baby monitor. The only advantage these Silent Play units have is that you can use existing FM receivers to listen instead of another scanner.

>
This is what I've been looking for. THANK YOU

>Just went down to the local Radio Shack to pick up one of these
>after seeing it in the newsgroup. Had to convince the clerk that
>it existed (found it in the catalog for him), then find it on the
>shelf. In any event he had it so I took one of the new Radio Shack
>catalogs sitting on the counter, used the $3 coupon to pay for the
>catalog and the $5 off coupon to lower the price. Walked out with
>the unit for $15.

Before I even got to this message in the queue, I was on the
phone to a local RS store. I described the device as I read
it described here. "Nope nothing like that" I said it was
called Silent Play. "Oh, yeah we got that, but its some sort
of device for Nintendo, not what you describe" !!!

I called the other local store. "Nope,.... If you had a part
number..." Coming back to this group, I continued to read
until I found a part number. He looked it up and sure enough
they had three of them, "but they're for Nintendos, not an
FM transmitter and reciever"

Just for back-up in using my $5 off coupon, I printed out this
message (above) and gave it to the manager to show him the part
number this afternoon when I bought my Silent Play. He didn't
read it before I left, and I didn;t have to refer to it to get
$5 off. He rang it up with no questions $15.74 with tax.

As he was bagging it up I asked for a catalog and he put a new
one with a new $5 off coupon into my bag. I'll buy another
Silent Play tomorrow if I like the way it works tonight.

I am especially impressed that it comes with an RCA to 1/8 adaptor
(as well as 1/8 to 1/8) This was more than I had hoped for.

About 7 or 8 years ago I got a call from my brother telling me
about a clearance on the Uniden 2021 (a Sony 2001 clone) at
National Tower. Myself and three others here in the department

quickly called and charged the $79 - 89 radio. Upon delivery
we were all well satisfied.

I never thought we would find a bargain like that again.

Then I discovered Rec.radio.shortwave (as SWL-L) where there has
been an unending string of winners!

I owe my ownership of a Pomtrex, several SRII's (from Bennet Bros
and from Thomson refurbs), a DC-777, and a Radio Shack 2006 scanner
directly to the notifications of super bargain prices or great
deal notifications posted here.

I am sure that the Silent Play is yet another classic buy.
I learned my lesson on the Pomtrex. These bargains are very
fleeting and you better buy two if you really need one. You'll
regret it for a long time otherwise. I should have bought
10 Pomtrexs and SRII's based on the current demand for them.
Hind-sight... (I couldn't afford extra DC-777s or 2006's)

Thank You! Thank You! Thank You!

I'll keep my eyes open as well and hope to reciprocate to the
benefit of you all.

(anyone have a line on the GE cordless and corded phone combo
that WalMart sells for $125 new, but Damart has for $60 or so?
I figure Thomson refurbs probably has some for about $30 - 40.
Any Thomson employees out there with a current refurb flyer
number who could provide a list of goodies now being offered?
Seems like they ought to have used SRIIIs in stock by now)

Thanks in advance.

Yes, I'm selling my PRO-2004. (The business band restoration has not been done, but it is pretty simple.)

Modifications:

6,400 channels (16 blocks of 400)
LED center-tune indicator
10-segment LED S-meter
Transformer removed (runs cooler and quieter on external 12VDC)

Peripheral:

AIE TCF-4 Tone/Code Finder - detects CTCSS (PL) tones and DCS codes, allows programming of up to 10 tones/codes per scanner memory channel for decode.

The closest replacement scanner available now is the PRO-2006 at around $330 (average) by mail-order. The TCF-4 costs about $350 new.

Asking price is $400 with shipping included. (I will negotiate with local folks who could pick up the unit from me.) ((Personal check must clear prior to shipping.))

You can contact me in the following ways:

Voice telephone (716) 254-1726 during the evening.
FAX (716) 273-1078 anytime.
Fidonet mail to 1:2613/333.2 (route to my Boss node)
Internet email to david.stark@rochgte.fidonet.org

There have been several postings about battery packs going bad.
The battery pack in my sons 100xlt (same as in the 200xlt) died of
neglect. Instead of forking out almost 40 bucks, I took the case apart,
and went to a local electronic supply (Electronics Supply, 250 NE 45th,
Seattle, Wa (206) 632-2222). They have a fantastic supply of batteries,
nicad, and gell cells.

Don made a pack, welded straps between the cells, glued,
and shrinkwrapped the pack for a little over $16.00. These were the
exact replacement Sany cells that were in the unit originally. After
this all I had to do was solder two wires, just like the original pack,
and screw the case together.

I am sure that most major cities have a similar electronic
supply store that can provide this service. Failing that you can go to a
good hobby shop, or order batteries from mail order firms like Tower
Hobbies (check r/c magazine). When I have to make my own packs, I use a
piece of thick solderwick to interconnect the batteries. This provides a
sturdy, low resistance path between the cells. Shrink wrap tubes are
available insizes big enough to seal a D cell pack.

I have saves a lot of money making battery packs this way. I
have some R/C vehicles, and boats that I have made 12 volt 5 amp/hr
packs at about 1/2 of the original packs.

Hope this helps.

Have fun.
Ken O.

2212. RADIO HOBBY OVERVIEW - A proposal

Newsgroup: rec.radio.scanner
Date: 1994-03-31 23:24:07 UTC
From: karayan@blitzen.cc.bellcore.com
Message-ID: <2nfm2n$6i3@blitzen.cc.bellcore.com>
Source record: 275883

This posting deals with an idea which I think is long overdue. I certainly don't need to mention to readers of this group how incredibly diverse the radio hobby is. This hobby has something for everyone! I just thought that we need some sort of a navigation map to take someone by the hand and show what is / can be done by a radio hobbyist. Such a thing would serve a newcomer in selecting some specific interest, but will also allow the seasoned radio hobbyist to move on to some new niche.

Before diving into such a project, I need to find out if anyone else has done something similar. I know of the intro articles posted here regularly, but I'm looking for something in a higher level of abstraction and all-inclusive. I started to build something. Here is a sample:

********** Begin sample **********

GUIDE TO RADIO HOBBY ACTIVITIES

This article attempts to provide a map of activities available to radio hobbyists based on the frequency spectrum. The intend for it is to serve as a navigation tool to anyone looking to enter the radio hobby, or anyone who wants to explore new horizons. The map contains a fair amount of detail, including some rather esoteric niche interests, but it does not pretend to be exhaustive. Special codes point to netnews groups where more info can be found. They are:
(SH)= rec.radio.shortwave; (SC)= rec.radio.scanner;
(HAM)= rec.radio.amateur.misc; (BC)= rec.radio.broadcasting;
Any additions/changes/corrections should be forwarded to George, N2OWO, at karayan@cc.bellcore.com .

```
FREQUENCY | HOBBY ACTIVITIES | EQUIPMENT REQUIRED
RANGE (MHz)| |
===========|=============================================|====================
0-0.03 | Hunting for whistlers (natural radio) [SH] | Special receiver
| | or converter +
| Listening to LORAN stations [SH] | a longwave receiver
-----------|---------------------------------------------|--------------------
0.15-0.45 | Hunting for distant marine and aero beacons | Receiver with
| [SH] | longwave band
-----------|---------------------------------------------|--------------------
.18-.19 | Low power transmitting (propagation studies, | Homebuilt xmitter
| comms) LOWFERs: no license required [SH,HAM] |
-----------|---------------------------------------------|--------------------
.45-.5 | Hunting for marine CW stations and emergency | Receiver with
| comms [SH] | longwave band
-----------|---------------------------------------------|--------------------
.5-1.7 | Casual broadcast listening [BC] | AM radio
| Hunting for distant AM stations [BC,SH] | Better AM radio
```

```
| Low power xmitting - no license [SH,HAM] | Homebuilt xmitter
-----------|---------------------------------------------|--------------------
108-138 | Listening to airliner and airport comms [SC] | Scanner
-----------|---------------------------------------------|--------------------

******* End of sample ************
```

As you can see, it provides the reader with an overview of what is done in radio hobbyism and it's as inclusive as possible. All info is arranged by frequency, so that someone with a radio can figure out what a given set of freqs can do for them. There are also references (the [..] flags) to netnews groups where one can go and find out more.

Don't worry about the specifics listed in the sample above. Just let me know what you think about the idea. I can create the whole thing and then post it to various rec.radio.* groups for comment/corrections/etc. Then, the (ever-evolving, no doubt) article can be posted periodically in the rec.radio groups.

Any comments/suggestions/pointers/flames?

George Karayannopoulos N2OWO

You might also consider the Uniden MR8100. It has an RS232 interface and comes with the software and the connecting cable as a package deal. The latest Scanner World catalog has it for $289. An added plus is the radio covers cellular if your interested.

kr> Is this a good scanner for medium to casual use???(mainly by my
kr> wife...) I should say that this will be in a medium RF area as well...

kr> -Also does it scan in 30khz steps in appropriate freq ranges??

Hi, Jason...
I would say that it is an appropriate scaner for your use. And yes, it
can do the 30 khz stepping after the appropriate mod. Let me know if you
want the mod and I will dig it up for you.

Jerry

Hi Bill,

Here's what I have for Des Moines (where I live)

Des Moines Police - 460.025, 460.150, 460.225, 460.325, 460.400,
460.500
Des Moines Fire - 460.575, 460.600, 460.625
Iowa Methodist Medical Center
Life Flight - 155.175
Security - 463.700
Polk County Sheriff - 154.815
155.580
Iowa State Patrol - 155.640
Urbandale Police - 159.210
Mutual Aid - 154.770

I also believe there is a Ham radio repeater at 146.940.

I hope this helps.

Most of the battery places advertised in the ham magazines will sell you a
new sanyo pack all ready to go for 20 bucks.Go to a local hamfest and if it's
not a tiny one,somebody will be there selling packs,just make sure it's put
together right or it wont fit.They sell a specific pack for bearcats.

I'd like to know the answer to this, too! When I worked for Rescue Eight out of Arlington Heights, we used to listen to CPD on our scanner. There are sections of the JFK and IKE where this happens frequently. I came to the conclusion that it might be phone patches coming through, especially to detectives on the tactical channels for CPD. Is this kind of patching possible, anyone, or does it only happen in the 800-900 mHz range? Chicago Police has only recently switched to some 800 mHz channels.

George--

Over my many years of listening, I've had people tell me that Radio Shack antennas are bad, overpriced, below average, etc. This is wrong! I owned a discone antenna from Radio Shack, and, coupled with some expensive coax and good weather-proofing of the connections, got unbelievable reception. I was treated to exciting skip traffic, often heard Lo-Band and VHF on a regular basis from up to 70 miles away in skips.

Make sure you mount it around 30' off the ground and keep it away from trees, power lines, other antennas, and any venting/attic fans...I found these factors to affect my reception, especially 800 mHz.

Good luck,

>set defined by the COMMtronics HB-232 computer interface
>for the PRO-200* radios? This would be a list of the
>functions of the radio that can be controlled, like
>"set memory channel to X", "load VFO with frequency Y"
>and so on.

COMMtronics sells a developers kit. It comes with a short (10 pages or so)
manual and diskette containing a sample BASIC program.

In short, there are a series of 2-digit hex commands you send to the HB-232.
It will then respond with a string of up to 24 bytes of information. Each
byte contains specific details about the unit's display at the moment sampled.
The 24th byte is a checksum. To sample the display you must create a loop
that constantly issues an update command and then reads the 24 bytes of data
returned. What you do with the data from there is up to you.

P.S. Has anyone out there written any routines for this thing? I am thinking
about some, but hate QuickBASIC. I was hoping someone might have translated
the routines in the sample BASIC program into Pascal or C.

>
>
>Louis

Well, I'll say it again. If you're the hardware type (vs. the kind to
send it back to the store for repair or buy a new one), open up the
battery pack and poke around in there. I found in my 100XLT that the top
of the female barrel connector had become separated from the bottom of the
housing. This is significant because the center pin connector is attached
through the top of the connector. Therefor, when the scanner is moved
even slightly, the center pin becomes disengaged from the inside of the
barrel plug, breaking contact and killing the scanner power. Of course
this is when the power plug is in: but when the plug is out, the contact
which gives power to the scanner from the battery becomes loose, too, and
the same thing happens (if I am remembering correctly).

Hope this helps.

Sherrod

Hello:

I am in the market for a hand held scanner. One particular model
that that seems to have everything I would want is the AOR 1500
hand held scanner. This model has full frequency coverage from
500 khz to 1500 Mhz with no drop outs. I am particularly interested
in being able to receive the military band 225-400 Mhz. This scanner
also has A.M., F.M., and N.F.M. receiveing capabilitites. Most of the
Bearcat and Radio Shack type models all have too many frequency dropouts.

Can anybody post some information on the PROs and CONs of the AOR 1500 model?
Any recommendation on other radios I should look at would be most appreciated.

john

Tandy and value don't belong in the same sentence? Go for the real Uniden? Since most Radio Shack scanners aren't made by Uniden this is a most confusing statement. The best scanners at Radio Shack are made by GRE of Japan. I guess you never heard of the Pro-2006. Since it's possibly the best, and most inexpensive high line scanner on the market, it's hard to hameer Radio Shack. The Pro-43 is a much better scanner than the R-1 will ever be. I really hate to talk about Icom that way since I love my R-7000 but when I purchased my R-1 at work I called Icom to complain about the poor job they did with intermodulation. Their answer? "Well we only used 1 bandpass filter, small size is what people wanted, not supurb performance" I guess they admitted they can build junk.

I guess there are people who'll buy anything in the face of better products, look at Beta versus V.H.S. (Very Hard to See) Marketing is the key to selling the public anything.

Oh well, I guess I rambled enough. I never use the R-1 I bought for work, I always bring in my Pro-43(which isn't perfect) but has a hundred less problems than the R-1.

Uniden on the other hand can't touch the quality of a GRE radio from the Rat Shack. Uniden hasn't made a radio that was really worth owning in years. The 2500 was an attempt, intermod and battery problems, although corrected somewhat now, they still released the junk on the public before fixing it. My friends 2500 only got an hour out of it before dying. Uniden however did send him a new battery and upgraded his unit to one with a lot less intermod problems. Unidens service department has been known over the years to be very fair and even ignore mods that have been done under warranty.

Just wondered why you put Uniden and Realistic together? Most of the radio's aren't Uniden.

From the guy who's gonna take a lotta hits from
the R-1 and Uniden fans<g> but that's what this is all about.....Les

I've tested my DC adapters output and it's putting out 11 vdc.
The PRO-43 needs only 9 vdc. The local RS says this is ok and
they even tested their other 20-188 supplies and they are putting
out 11 vdc as well.

Is this OK? Or will this shorten the life of the scanner?

2228. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-04-01 17:33:40 UTC
From: bill@thd.tv.tek.com
Message-ID: <2nhltk$d51@news.tv.tek.com>
Source record: 275902
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 01-Mar-94]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner listeners. The FCC master contains a wealth of data about every non-government license in the United States. Most of the sources below contain a subset of this data, although a few contain all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing the data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain.
| However, most software supplied to view or manipulate the data is
| copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on disk by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

Lee Reynolds (lee@tosspot.sv.com) has made available copies of the entire FCC master on microfiche for $75 a copy. There are three sets in all - by callsign, geographic area, and frequency - for a total of about 200 fiche. His current set is from early 1993. E-mail Lee for more information.

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells a variety of FCC data on CD-ROM and floppy. CD-ROMs are available by state, region, or category, and floppies are available by state. Also available is a CD-ROM of the entire US (2.5 million records). Data is updated approximately every six months.

| State floppies are $35 per state. CD-ROMs are $100 each. Quantity
| discounts available. PerCon can be reached at 716-386-6015.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.0. It comes with FCC data for one state, covering all services from 10 kHz through 2036 MHz. Data is updated approximately every six months (last update was Dec. 1, 1993).

Cost is $35 for the first state and $20 for each additional state. (Add $5 | for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "*" or the field length, if known.

>-Keith
I have owned a 145XL for several years and find it a nice little rig. I
live in a rural area and the 16 channels were plenty. In an urban area you
would find it inadequate. The coverage was 137-174 and 406-512 MHz (all
FM). A few drawbacks with the 145: - the fact that the display
shows channel only, not frequency. On command it will show you frequency
one digit at a time. It has lockout, priority channel one selection, and
instant wx. Also there is factory 2 second delay which is not switchable.
The scanner will not search either. I recently sold mine and moved up to
an 890XLT. Was impressed with Bearcat and stayed in brand.

good luck...73 de BT

Also, a few years ago, I found some handhelds being used at Busch Gardens
(the Williamsburg, Va. one, don't know about Fla.) in the 460 MHz range.
These were being used on the tram that goes from the park to the brewery.
Hope this helps!

10.525 GHz = X
24.125 (?) = Ka

The laser ones are literally that - light. I assume they modulate the beam to be sure it's them they're hearing and detect either round-trip time or doppler on the modulation.

Check the voltage while the unit is pluged in a turned on. I noticed
this on several power supplies I have used with my DiskMan.

>Where can I get info on cellular mods for the Pro-46?
>Thanks.

Here's what you're looking for (from 2 different sources).

Product: Realistic PRO-46 by Radio Shack
Purpose: Restoration of full 800 Mhz coverage

The modification of this unit is from the May, 1993 issue of Monitoring Times, published by Grove Enterprises.

** Disclaimer: All modifications are done at your own risk. This product uses surface mount components which can be easily damaged. Do not perform this modification if you are not experienced with this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then push upward on the bottom of the rear of the case, carefully swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards next to the interconnect plug in the lower right corner. Gently pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor and set it aside. ** CAUTION!! Too much heat will damage the shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder and remove both.
6. Solder one chip jumper across the two upper most unused solder pads. (Soldering a jumper across the lower two pads changes the 30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.

Pro46.Mod
You will be able to tune continously from 80?whatever to 95?whatever and this will include the appx 870 - 890 cellular band with the proper 30 MHz steps for the cellular frequencies.
1.Remove battery pack, battery door and antenna.

2.Remove the 4 black screws on the back of the radio: push upward on bottom at
rear case and cantliever (swing) case half up from bottom to separete and remove, its not necessary to remove belt clip.
(note: This sounds much easier than it is. Be prepared to "prop and lever" around 3 catches in the battery case, along with one on each side around 1/4 of the way down the case)
3.Carefully separate RF board from processor board by inserting eyeglass screwdriver between board by plug-in connector.
4.Unsolder copper-coated plastic Rf shield from microprocessor and set aside.
(note: If memory serves me correctly, this SHOULD be the side where the pushpad is. In order to follow the rest of the instructions, place the scanner face down on a piece of cloth or in a clamp with the antenna facing AWAY from you).
5.Locate two resistors marked "0" (zero) on right side of board.
(note: On mine they were labeled "000", not "0")
6.Carefully unsolder and remove BOTH of the resistors.
7.Reinstall ONE of the removed resistors (or jumper) on the UPPERMOST set of EMPTY solder pads.
(note: These are located just to the left of where you just removed the two resistors.)
8.Thats it, reassemble the radio.
PS-Reintstall one of the removed zero marked resistors into top set of empty solder pads. DO NOT install anything into LOWER SET of empty pads (cancels 30-
50 mhz and adds 68-88 mhz.

Hope these help you. Mod. worked fine for me.

Jim Fordyce

> Is this OK? Or will this shorten the life of the scanner?

It is my understanding that you will see a higher voltage than rated when you test the output with no load. The amount of amperage a power supply can provide is also important in determining the proper one to use.

If you have a device that is designed to use a 9 volt supply with a 500 milliamp capacity, and instead you use a 9 volt supply with a 1000 milliap (1 amp) capacity, you risk damage to the device.

The supply will produce higher voltages when a device is drawing less current than what the supply was designed to provide while staying reasonably close to the rated 9 volts.

I don't know if there is a standard formula, or how much extra current capacity should be alowed, but I know a good rule of thumb is to always get a supply with the proper voltage AND current rating that correspond to the printed requirements of the device you are powering.

////////

You're better off listening to the local P.D. and the news media
frequencies for your area. SS uses digital encryption on Presidential
details and all you will hear is white noise. If on the other hand,
you listen to local P.D. tactical channels and the News Media they
have EXTREMELY POOR Communications Security.

On one local visit to CA, the local P.D. was giving a street by street
update on a clear tactical channel, while the SS was encrypted.

News media is the worst, you learn EVERY move before hand so they can
set up for a photo opportunity.

On his last visit to L.A. after the earthquake, the White House press
Agency had to ask (not too politely) that a local T.V. station news
helicopter STOP giving the motorcaide route by street name (The idiot
was actually calling off the streets he was approaching).

Personally, I am surpised the Secret Service is so sloppy. My own
people in the private sector are not that sloppy !

Hope this information helps out.

Help,

By some luck I will be recieving a bonus check from work. I need help spending it. OK OK. All you who raised their hands put them down. I mean to buy a new scanner. I currently have a pro2005 that I just got a offer of 2 HardDrives (a 450 and a 250 MB) for the scanner. The person has no use for the drives but wants the scanner. So I am forced to buy a new scanner. I was looking at the RS-Pro2006. But I want a computer interface. One I dont have to put together. So I was looking at the AOR-2500 listed at $449. Does anyone out there have one of these if so what do you think about it. or does any one else have a suggestion for me. And By the Way I only want to spend a max of 500-550 dollars.
Thanks in advance.
Alan

Hello
Can you help me? I am trying to find out which British Police
forces are currently scrambling their radio communications.
Does your local force ever scramble its radio communcations?
If so could you let me know the following ..

Do you know what the scrambling system is?

Is it used by officers on the beat or only special squads?

Do you know what kind of radios the system uses?

Which Police force is this?

Don't worry I am not from the RIS! If you respond to my anonmyous
address which is in Finland the computer will strip your address from
the message before mailing it on to me.So unless you tell me or leave
your tagline in the message I won't even know who you are!

Thanks

" REAL MEN, USE INTERNET "

2246. Attn: Camnis HCS-050 users

Newsgroup: rec.radio.scanner
Date: 1994-04-02 12:58:01 UTC
From: leowaltz1@aol.com
Message-ID: <2njq4p$ln0@search01.news.aol.com>
Source record: 275904

Having just received a Camnis HCS-050, I would like to start
a thread here on its operation, which has good and bad points.
The unit was received less than a week after it was ordered
from Javiation in the UK (faster than most US companies ship
things.)

I will start right off with the major problems I have seen.
The English version of the Japanese user manual appears to
be a translation, and it is not well written. In most cases
they leave you dangling after an operation is described, with
no information on how to exit the function. In one case, it
is pointed out that "including" banks is easier than "excluding"
banks, but then fails to explain how to do the "include". Bank
"linking" is discussed as a third alternative, and is fairly
clear, except how to unlink. And this brings us to the unit
itself:

1. There are no instructions on how to do a master clear of
all programming. I had to manually delete over a hundred
channels which were in memory when the unit arrived.

2. The priority function has two flaws:
-- A popping sound every two seconds when searching as the
priority channel is checked. This can only be eliminated by
turning to squelch to near maximum, which results in some
transmissions not being heard. The popping does activate a
VOX in a tape recorder.
-- When searching is pre-empted by a priority transmission,
and when manually de-activating the priority checking, the
HCS-050 loses track of the frequency being searched and goes
to the beginning of the search range that it was in at the time
of the interruption.

3. I cannot get the mode (AM,NFM,WFM) changed on individual
channels. This may be another void in the instructions, but
I can only specify mode for a search range; otherwise the mode
button does not do anything. I have found a workaround in that
I can set the mode for a search, then suspend the search with
that mode still being indicated, then load the channel. But,
I still have some channels entered in AM that should be NFM.
Help is needed on this one.

4. The squelch does not completely silence the speaker. There
is always a low volume noise.

Also there is a readout of "TRX" on the LCD that is not shown in either manual. It is just to the left of "BANK" under the "PRI" readouts. It obviously means I did something wrong.

I forgot to mention that the popping sound in item 2 also happens when the unit does a search range shift.

Well, this is a start. I will get to scanning in the next note.

Message-ID: <2nkmid$44k@usenet.INS.CWRU.Edu>
Source record: 275906

**B00000000000000

Subject: Icom-R1 & BC-8500XLT

I have various, somewhat expensive hobbies, and I find
that "Scanning" is one of the most exciting! I have
20 years of experience in electronics. I design "Turnkey
A/V Presentation Systems" for boardrooms and training
facilities. I purchased my Icom-R1 at the Dayton Hamfest
several years ago. I use the R1 at work to "look" near the
frequencies of wireless microphones, (mainly in the TV
band), confirming their quality, stability, and lack of other
carrier in the area.
Since then I have found a world I was aware of, but had
not experienced (scanning). I recently became a member
of FREENET (I'm Backpacking on the Info-Highway).
I also recently purchased the a new scanner
- BC-8500XLT -. This purchase was to make up for the
few things the R-1 lacked, (there is only a few).
The 8500 works well for all my needs (amateur, police,
fire, emergency, cordless and cellular - (at 400mHz above
the original signal), but would like to have the nice 30kHz
spacing.
I read about the trashing these units take from people in
the BIG CITY (one more reason not live in one).
Also have read about the new imports with 1-99 spacing!
WOW ! This seems the way to go as frequencies become
more condensed. With April 26th approaching, would it be

a good idea to trade in my R1 for one of these beauties?

Are they still available? Where?

How do I explain this one to my wife? $$ HOBBIES $$?

Comment:

I also feel like a kid who is about to get his lollipop taken away by a bully. SCANNER PARANOIA from an uninformed congress is pitiful. Cellular lobbyist/s must have paid out dearly for this one, (I voted for Perot can you tell?).

I am also concerned about the recent closing of nodes to other scanner services. Am I to imply (with the deadline approaching), that someone is applying gentle pressure on places of higher learning?

Boy am I getting an education!

My real question ....Has anyone "Done" the BC8500XLT ?

By the way thank you for this forum, keep up the good work. The exchanges by individuals and the material are both hilarious and informative. Great stuff!

Happy Easter

>what do you think about it.

Alan,
I had one of the AOR-2500's for about 10 days and returned it to
the dealer for a full refund. It was so prone to overload from local FM
stations (and those NOT so local) that listening to much of anything was
a hassle. It had a nifty computer interface and control software, but the
poor performance FAR outweighed this marginal advantage.
I have told this story on many of the computer nets and have yet
to hear from another user disputing my opinion that the 2500 is not a
desireable scanner. I'd avoid it like the plague. Saving up more money
for an ICOM R-7000/7100 is well worhwhile. I bit the bullet and di it and
haven't regretted it for a moment.

Today I visited HRO in Atlanta and noticed several books of interest. Ferrell's CONFIDENTIAL FREQUENCY LIST Eight Edition. Pub Gilfer Shortwave This publication has been around since 1992. Lists frequencies used by Aero, Commercial, Embassy, Marine, Military, Government stations worldwide in the HF bands. 535 pages. Includes voice, rtty, cw and fax modes by frequency. I like it and bought it. Tunnell and Kekty's MASTER FREQUENCY FILE 531 pages Pub Tab Books This publication is new for 1994 and picks up where the first ends, covering the vhf and uhf spectrum. I like this one very much as it seems to be the best book ever for use with a scanner. I own Radio Shack directories, the New Monitor America and various other older publications but this book is the neatest, especailly for it area of coverage. For example listings look like this

Notation Function F Input Output Tone

KFP990 Nationwide Swat 167.5375 163.8625 167.9

f= channel id number if used

FBI DEA SS Customs IRS Immigation-Border Patrol US Marshals Prisons Noaa and National Parks , are some of the areas covered from 25MHZ to 2110 MHZ.

With the multi-million dollar secure communications system aboard the Air Force 747 that carries the President, Don't expect him to travel in another plane. It's only Air-Force-1 when he is onboard, when he isn't it's not called air force one.
Les

2255. Re: PRO-43 and Cellular

> I just purchased a PRO-43 and unlike my BC 200XLT I can not search 896 -
> 915 Mhz. My XLT will receive yet the PRO-43 only gets a carrier. What's
> the story?

Well,the story is that the cell band is from 868.950 to 894.000,so you aren't missing anything as far as cellular goes.All you were hearing on the 200 was images of the real thing.Bearcats are famous for this.About the only thing you might hear at about 900 is the new cordless phones,and you won't hear them for any distance compared to 46mmhz.I miss the OLD cordless phones that were on 1.6 to 1.8 mhz!They went for miles!Congrats on the 43,I replaced my 205 with one and am very happy with it.

2258. AR2800 mod

Newsgroup: rec.radio.scanner
Date: 1994-04-03 05:15:07 UTC
From: dilligaf@netcom.com
Message-ID: <dilligafCno3x8.Gx8@netcom.com>
Source record: 275916

I saw the mod to restore the AR1000 missing freqs (600-800MHz) and was wondering if there was a similar mod for the AR2800 (since they use the same processor, etc.).

th

2259. Pro-34 scanner for sale

Newsgroup: rec.radio.scanner
Date: 1994-04-03 05:18:12 UTC
From: parv@kimbark.uchicago.edu
Message-ID: <1994Apr3.051812.24208@midway.uchicago.edu>
Source record: 275826

After being on the other end of the microphone, my interest in listening has diminished to the point where I don't use these any more.

Realistic Pro-34 Scanner for sale

Handheld older model, but still better than most out there. 800 MHz capability. 200 channel capacity. $160.

I will toss in the car power adaptor, car antenna, and my scanner books with this. (If anyone is interested in purchasing these separately, make an offer.)

I also have a cardioid mike and sound level meter (not SWR meter) for sale.

If you don't think the price is reasonable, make a counter-offer.

2260. WANTED: Comments on Oakland FTP site

Newsgroup: rec.radio.scanner
Date: 1994-04-03 06:31:14 UTC
From: wy1z@netcom.com
Message-ID: <wy1zCno7G2.EEE@netcom.com>

Cross-posted to: rec.radio.amateur.misc,rec.radio.scanner,alt.radio.scanner,rec.radio.shortwave

Since the Boston ARC archives (oak.oakland.edu:/pub/hamradio) have been
available for some time now, and many of you have acquired many programs
from it, I would now like to ask for your comments.

Please comment on:

* What you like about what the site has to offer

* What you do not like about what the site has to offer

* What changes you would like to see

* What you would like to see added/subtracted from it

* Any other specifics

Please send your comments directly to me, as I will not be reading news
much for the next few months.

Thank you very much.

Scott

>Force 747 that carries the President, Don't expect him to travel in
>another plane.

Actually, Clinton has used another smaller aircraft for some short trips, ostensibly to avoid the high cost of operating the 747 for short jaunts. I have no idea how the smaller aircraft is equuipped.

It's only Air-Force-1 when he is onboard, when he isn't
>it's not called air force one.

Thats true, but only if he is on an aircraft under AF control. When he's in the shuttle helicopter used for White House trips to Andrews, Camp David and such, it's known as Marine One.

I know that there are designations assigned by the military and FAA for aircraft operated by other services for presidential transport as well. Clinton has been in Navy aircraft as well in the recent past.

What I do not know is what the arrangements are for civilian aircraft. No doubt someone else does. I also know the White House Telecommunications Agency and the military have portable comm gear used for these trips.

Now, if Clinton rode Amtrack, what would the desination be?

I will simply Never understand why manufacturers of *everything* with
an external power input don't spend and extra spec of a penney, and
put a blamed diode in there to prevent reverse polarity from reaching
the electronics! So you'd lose .6V, with most things (especially
things that run from car circuits), it wouldn't matter.

2264. >>> Crystals Wanted <<<

Newsgroup: rec.radio.scanner
Date: 1994-04-03 20:54:01 UTC
From: robb873302@aol.com
Message-ID: <2nnad9$gel@search01.news.aol.com>
Source record: 275921

Hi!

I'm looking for crystals for a couple of older scanners I've got laying around:

Bearcat
460.050
460.150
460.525
460.575

Realistic/Regency
460.050
460.150
460.525

I'm also interested in trading computer stuff (including memory) and other misc. equipment for scanners, ham radio, SSB CB equipment, etc.

Please Email to: RobB873302@aol.com

THANKS! - Rob

2265. RS 2006 best buy?

Newsgroup: rec.radio.scanner
Date: 1994-04-03 23:38:27 UTC
From: pthompson@walnut.prs.k12.nj.us
Message-ID: <1994Apr03.193827.829019@walnut.prs.k12.nj.us>
Source record: 275922

OK- I've been reading hear for the last few months to see just what would be the best scanner to upgrade to from my Bearcat 760 with CTCSS tone board. It sounds like the RS Pro 2006 is a very good scanner at a good price, that should perform well in an urban area with lots of transmitters nearby. I plan to add both a computer interface, and one of the PL/DPL decoders/displays.

Am I reading the comments here correctly? Should I run out and buy one before they dissapear? And particularly- if I get a Pro 2006, will it be the "classic" model with the various modification possibilities, or is RS going to use the same model number with a revised board/firmware?

I've been shopping at Radio Shack for years, but my experience with various RF items hsan't given me the best faith in their products. I'm willing to try again though. Who actually makes the innards of this scanner for RS?

2266. suggestions for combo ham/scanner xcvr?

Newsgroup: rec.radio.scanner
Date: 1994-04-03 23:47:57 UTC
From: weisen@alw.nih.gov
Message-ID: <1994Apr3.234757.18960@alw.nih.gov>
Source record: 275923

I'm working toward my no-code tech license and wanted to know if anyone had suggestions for good general coverage scanner/2M handheld, I'd appreciate it. A number of units have been mentioned, but I'm curious what people think of them as scanners. I'd love my Pro-43 with a transmitter tacked on :-).

Also, although I'm not interested in cellular scanning, I do listen to 800MHz trunked systems so if any models are going to be particularly destroyed after the 26th cutoff date, I'd appreciate the info (and won't wait to make my purchase).

Regards,
Neil

>>etc. call or scanner conversation you've ever heard.

The best one I've heard for a while was on the local Fire Service
channel;

"Regional Control from Fire Commander O'Neill"

"Fire Commander O'Neill, go ahead."

"Could you please call my home"

<Pause>

"And ask them to turn off the oven."

2270. Pro-2006! What does the cell mod do?

Newsgroup: rec.radio.scanner
Date: 1994-04-04 02:34:04 UTC
From: bobwx1@nbnet.nb.ca
Message-ID: <bobwx1.6.0@nbnet.nb.ca>
Source record: 275827

Hi Everyone,

In my copy of the "Canadian Scanner Handbook" I read that by clipping the appropriate diode for Cellular restoration, it restores the "FULL FREQUENCY RANGE". Can anybody tell me if it restores the 25 kHz to 1300 MHz range (since 600 MHz range is blocked out) or only the cellular range. Also I read a posting from a fellow in Nova Scotia a few days back who said the 2006 was on sale for 399.99 (or something). Is this sale still on and if so for how long. Also thanks to all of you who replied to my question about the cell. mod for the Pro-2022. It performed it on my father in law's scanner over the Easter weekend and it worked GREAT!

Neil,
I have and recommend an Alinco DJ-580T. It is a dual band (2
meter/ 70 cm) ham handheld that will recieve most typical scanner
frequencies right out of the box and a simple mod will enable listening
to cell phones and other 800 mHz stuff (I don't do it, but...). It has a
toatl of 40 memory channels for ham freqs or scanner listening and search
banks for finding new freqs.
A darn good ahm radio and a decent backup scanner in its own
right. In fact, it is a better scanner than the first 2 or 3 scanners I
owned!

The Icom IC-2SRA would be a good choice. It has wideband receive from 25 to 950 MHz. It looks a bit geeky with two antennas, but it's a decent combo rig. I've since switched to carrying two radios again... the Yupiteru MVT-7100 because of even broader coverage plus better scanning facilities, and the tiny Yaesu FT-11 2m rig.

Mine is happily sending from the tv/vcr setup on the ground floor to the FM receiver in my office on the second floor -- the antenna for which is a simple dipole tacked up in the attic. In stereo, yet. Total distance? I haven't a clue but it's a lot more than 20 feet. The use of a full-blown receiver instead of the cheapie FM radio that comes in the Silent Play set helps a lot here. (But it also necessitates VERY careful tuning of the transmitter, these new-fangled digital FM receivers don't take kindly to signals that are slightly off-channel!)

Another good dual band HT with similar features is the Icom IC-W2A. It's a keyboard "mod" for cell freqs. and there's also an internal mod for extending the tx freqs.

> GEnie:D.MORISSEAU

So you've stuck it out there, hey Dan? I find AOL a much better service myself, but I do miss some of the gang in the Radio RT. I still send Larry internet mail from time to time, though.

You have done something that I have been thinking about for some time now except I was trying to figure out how to do it in plastic. I found that I can power my BC-100 / BC-200 from the BP-5 battery pack used on my Icom IC-2AT. It seems to work quite well and the pack is almost the right width and depth to match up with the case. The real problem is that the mounting rails are two entirely different animals. I thought that with the right piece of Plexiglas, say about .5 thick with slots cut in the edges to match the bottom of the radio and the top of the battery pack, you could have a long life ni-cad on your BC-x00 scanner. Does anyone know if there is anything like this made out there? Anyone want to make one? If you do send me 10% of the profits when you get into full production and the money starts rolling in. :-) I may just give if a shot myself with wood. It should would be nice to have a one hour rapid charger for my scanner!

The Secret Service (or White House Communications Agency) isn't being sloppy. They operate under different restrictions than a private security company. There are actually some things that a private security firm could do, that the Secret Service is prevented from doing. My rights don't just evaporate when the U.S. President happens to be in the area.

Back to the issue at hand. One thing the S.S. seems to hate more than folks, like the news media, broadcasting where the motorcade is currently (too big of an event to hide anyway); is coded/encrypted broadcasts they can't understand in the nearby area. I've helped coordinate "civilian" communications at events when the president stopped by. The WHCA seemed most interested in making sure they could monitor our frequencies, not if we might broadcast something "secret." We had several hundred hand-helds all over the events in the hands of volunteers with no special security clearences (heck, I doubt some of them even had a driver's licenses).

I have seen considerable talk about this unit on Compuserve. You may want to look there to see if folks there have figured out the items missing from the instruction manual. People there seem to rate it better than a PRO-43 but not as good as the MVT-7100 (in case readers were wondering about the Camnis or Trident).

All things considered, the 2006 is a very good radio. You comment on RS RF products is true to some extent. Their quality (in manufacturing) is not too hot. My 2005 could never pick up 1.2 GHz Ham freqs. In the past few months I have noticed that 800 MHz is starting to fade. I have the sevice manual, so I figure I'll have to give it a tune up soon. Anyone else notice that the sensitivty is getting worse?

The PRO-200x series and others are made by GRE.

I have an old BC 210 XL that regularly leaks aircraft traffic into the 154-155 PS band. You can almost understand it, but it souds a little muffled and fuzzy. Its a little bothersome, but the air traffic seems to be infrequent in my area. If it happens on a frequency I really want, I usually use a different scanner to listen to it. The best way to ID the frequency, is to ask a pilot in your area - try calling the pilot shops that usually border airports, you can also pick up a "sectional chart" that has a big map with frequencies of lots-o-good-stuff for your area (aircraft).

2287. IDEA - temp. lockout and "softkeys" etc

Newsgroup: rec.radio.scanner
Date: 1994-04-04 14:27:09 UTC
From: brett_miller@ccm.hf.intel.com
Message-ID: <brett_miller.103.000E7452@ccm.hf.intel.com>
Source record: 275859

Two features that I've been thinking about lately are:

1. Temporary lockout keys. Often a frequency that I scan has some noise on it that stops scanning. I hate to hit lockout, since I know I'll forget about it tomorrow. My idea would be to have a lockout button that only locks the channel out for 10 minutes or some similar period. After the time is up, the channel becomes unlocked automatically. If the interference is still there, you can hit the button again.

2. Have a memory pool. Lets say you have 1000 channels. The user should be able to assign the channels in the banks they want - they put in their own dividers- i.e. ch 1 - 27 make bank 1, 27-200 make bank 2, etc. The user selects how many channels go in each bank. You could have one bank of 1000, 2 banks of 500, or whatever you need in each bank. The banks could be selected with softkeys - like the newer HP calculators. A key has an area on the display that shows what the key function is (the user programs the alpha characters). So the bank 1 key might say: LOCAL PD or FIRE. This way you can select banks by name. My 2500XLT has 20 banks and I can't keep track in my head.

Needles to say, good RF performance is a MUST. A scanner with lots of features is worthless if all you hear is intemod.

2289. re: Presidential Security

Newsgroup: rec.radio.scanner
Date: 1994-04-04 15:25:38 UTC
From: craigs@lobby.ti.com
Message-ID: <craigs.1115860778A@mksol.dseg.ti.com>
Source record: 275844

Bill was here in the Dallas area two weeks ago for his brother's wedding, so I had an opportunity to listen in....

Most of the SS channels ran DES encrypted, with the exception of Tango, which was usually in the clear. It was mostly ops logistics, and pretty boring.... "Dallas to Travis. Be aware Agent so-and-so is on at six." etc.

What was neat was listening to the Air Force 1 telephone downlink on 415.700. It was in the clear every time I checked. I couldn't hear the uplink because I was too far away, but hearing the downlink was neat... "Air Force 1 to Crown, request patch to xxx-xxx-xxxx...." etc. It was mostly flunkies calling relatives and such, but it was neat to listen to anyway. I caught AF-1 both inbound to Dallas and outbound to San Diego....

Happy listening.

Oh, also, per another poster's suggestion, I listened in on the Dallas PD channels. Nothing presidential related. In fact, from listening to DPD, you wouldn't even have known the pres was in town !! :)

2290. Suggestions for ultimate scanner design (proposal)

Newsgroup: rec.radio.scanner
Date: 1994-04-04 15:35:17 UTC
From: vhealey@crl.com
Message-ID: <2npc3l$7n2@crl2.crl.com>
Source record: 275840

Have you purchased a scanner only to find that it doesn't have
all the features that are found in a similar product from another
manufacturer? I propose to start a collection of ideas that list a
desirable feature or a proposed enhancment to exisiting designs that will
be listed here periodically.

Either add to this new thread or email to me at vhealey@crl.com
your suggestion for a new product feature or and enhancement to one that
already exists on some favorite scanner. That is your idea! Please tell
me what the benefit of your idea would be. I will compile a chart of your
submissions and comments which will be periodically posted here and when
it looks good enough we will submit it to all the leading manufacturers
for them to get busy on. Hopefully they will be reading this thread and
already considered adding this feature to their product line. Please be
specific, if an existing radio (ham or scanner or business) already has
this feature let us know the model and maufacturer so we can provide
proof that it can be done as it already has been. (also patents may be
involved) Please start all posts or email to me with the keyword IDEA -
so I can quickly sort through the messages. Your ideas may be engineering
changes that are operational, structrual, cosmetic, software, or what
have you.

Here is a sample post

IDEA - Anti slip case design for handheld

Why not design the ultimate hand held with a rough or raised
surface on the sides of the unit instead of a smooth surface?
The benefit is that it would less likely be dropped by moist
hands resulting in less damage to the unit over time.
Aor 1000xlt and Radio shack Pro43 are examples of this feature.
The bearcat line of hh's lack it since they are smooth cases.

submitted by Vic Healey ki4je vhealey@crl.com
....
....

I hope you get the "idea" and this ultimately results in some
better designed radios for us all to use.

Victor Healey

vhealey@crl.com

2292. Review of S&S Precision Mapping CDROM - use to pinpoint xmtrs

Newsgroup: rec.radio.scanner
Date: 1994-04-04 16:08:34 UTC
From: parnass@cbnewse.cb.att.com
Message-ID: <CnqsuC.B6J@cbnewse.cb.att.com>
Source record: 275842
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I posted this in alt.cd-rom and comp.sys.ibm.pc.hardware.cd-rom, too:

PRECISION MAPPING CDROM REVIEW

by Bob Parnass, AJ9S

I saw demonstrations of two CDROM mapping programs this weekend:

1. DeLorme's Street Atlas USA (v 2)
2. S&S Publishing's Precision Mapping

Street Atlas got good reviews here on Usenet but I didn't see any reviews of Precision Mapping, so here's my two cents. First, both these programs are remarkable and put CDROM technology to good use. They contain almost all of the streets in the entire USA.

The Street Atlas CDROM is called from Windows, versus Precision Mapping which is a DOS program. I think Street Atlas USA has one disk. The Precision Mapping setup comes with two CDROMS disks, one for the Eastern and one for the Western USA, using the Mississippi River as the dividing line.

I purchased the Precision Mapping because it includes a few latitude/longitude features I need which were missing in the Street Atlas. As you position the mouse, the exact latitude and longitude is displayed on the screen at all times. I need this feature in my application of locating transmitter sites from FCC records which often contain latitude and longitude but no street address.

Street Atlas prints prettier paper maps than Precision Mapping. The lakes are shaded in the Street Atlas printouts, but are merely outline drawings on the Precision paper maps. Also, the Street Atlas draws major roads with two parallel lines (i.e., giving the major road some stature to help make it stand out), and the Precision represents these roads (on paper) with darker lines.

Although the Precision maps appear in color on the screen, they are black and white when printed (even on a color printer). I'm using an HP Desk Jet 520 ink squirter printer, and the printouts look better than they do on my 14" cheapo SVGA monitor.

The only real problem I've had with the Precision Mapper so far is that the tutorial bombs with the error message "Integer divide by zero" on my IBM PS/1 486DX2 - 66 MHz. I phoned S&S and they said they know about the problem -- the tutorial won't work on faster machines. Although this defect was somewhat annoying, it's not a great loss to me as I learned to use the Mapper on my own, using the Help text.

I don't know much more about Street Atlas USA, but the Precision Mapping allows you to click the mouse on a street, landmark, lake, or river. An information window pops up and usually gives you more info. For example, it will often tell you what the range of house numbers is on a street, and what type of street it is.

You can "mark up" maps with your own notes or drawings using the Precision Mapping software, or save the file and mark up the map with your favorite graphics editor. I've clipped out an entire map and swept out parts of a map using the mouse and created .PCX files, which I then read into the Paint program.

I paid about $75 for Precision Mapping, and it came packaged with a Business phone book CDROM of low quality, but that's another review. :-)

2293. Re: BC200XLT Battery Rebuild

Newsgroup: rec.radio.scanner
Date: 1994-04-04 17:29:53 UTC
From: sprouse@n3igw.PGH.PA.US
Message-ID: <98@n3igw.PGH.PA.US>
Source record: 275843

In article <hrody-310394092416@rodypc.b30.ingr.com> hrody@ingr.com (H. M. Rody) writes:
>I have a BC200XLT Scanner whose battery pack has gone south. I ordered a
>replacement ($39 plus shipping) BUT I want to get a new set of nicads to
>repair the old pack. Internal to the pack is a Sanyo CADNICA Model
>6N-550AA, 7.2V 600mh nicad pack. Anyone know where I can get a another
>one?
>

You can try one of the following :

W & W Associates
800 South Broadway
Hicksville, NY 11801
Toll Free 800.221.0732
In NYS 516.942.0011
FAX 516.9421944

E.H. Yost & Company
Mr. Nicad
7344 Tetiva Road
Sauk City, WI 53583
Voice 608.643.3194
FAX 608.643.4439

Periphex Inc.
115-1B Hurley Road
Oxford, CT 06478
Voice 203.264.3985
FAX 203.262.6943

I have bought inserts (just the cell packs) from W & W Associates for my
Icom IC-2AT 2-meter rig and they worked well. I don't know that they
sell packs or inserts for the BC-x00 scanners but I would be surprised
if they did not. Haven't had to replace the one in my BC-200XLT yet.
I'm sure there are also other dealers around. I heard one time that
someone makes batteries and a drop in rapid charger for the Bearcats but
I have never seen it. These were just the first ones I ran across in
the April issue of QST. Hope this helps. Talk with you whenever. . .

2295. Hear AM air freq image on FM VHF rcvr?

Newsgroup: rec.radio.scanner
Date: 1994-04-04 17:53:40 UTC
From: mike@garfield.csuohio.edu
Message-ID: <1994Apr4.175340.7155@news.csuohio.edu>
Source record: 275850

What does an AM transmission sound like when heard on an FM receiver?
How about an IMAGE of an AM transmission heard on an FM band?

Occasionally, (on average, once an hour) I hear what sounds like off-
frequency splatter from an adjacent channel close to the one I
have tuned in my scanner. The frequency I'm tuned to is 154.935,
which is Ohio L.E.E.R.N. (used for police mutual aid, etc.).

The transmission I hear is audible but garbled, but definitely not
the "Donald Duck" sideband, but more like bleedover (splatter)
you hear on an adjacent CB channel if someone is transmitting
really close by.

I can't make out what the person is saying, but I do seem to hear
that familiar (400Hz?) background hum you hear on most tranmissions from
aircraft on the AM Air band.

My first assumption is that its simply off-frequency bleed, so I set
the scanner to scan three frequencies above and three below the
154.935, in the usual 5Khz spacing (.920, .925, .930, *.935*,
940, .945, .950) in hopes of "bracketing" the bleedover and catching
it on a frequency nearby. No luck. This lead me to think that perhaps
I was picking up an AM Air frequency image in the 150MHz FM VHF band.

So, I whip out the calculator and sure enough,
154.935 - 21.4 (2*10.7 IF) = 133.535 lands me right in the
AM Air band. Three questions:

1. What does an AM transmission sound like on FM? Garbled?

2. What is the likelihood that an AM image will show up and
break squelch on an FM band 21.4MHz above?

3. 133.535 MHz I do not recognize as any frequency being used
by either Cleveland Hopkins or Akron/Canton airports. Does not
show up anywhere in Police Call. (which really did not surprise me)
Any insight from anyone?

Stumped,

Mike

Is it possible to rx and display the data that is sent over the cell phones. For example if someone is listening to Cellular and picks up a data transmission from the beginning and records it on tape. Can this be played into a telephone to a modem and it be understood by a comm program???? Just a thought.

Scanning in Texas

|>show up anywhere in Police Call. (which really did not surprise me)
|>Any insight from anyone?

Most airband transmissions are on 50KHz spacings, especially the low altitude frequencies. This is for compatability with the older 360 channel radios still used in some older GA airplanes. Where congestion is a problem, frequencies with 25KHz spacing are being utilized. Since aircraft which fly in Class A airspace (above 18,000 feet) are required to have 720 or 760 channel radios, many of the 25KHz frequency assignments are used for high altitude sectors.

My spectrum allocation info lists the 132.025 - 136.075 band as being allocated to ATC voice use (as opposed to ground control, FSS, or Arinc, but isn't more specific. Most of the listings in this band for the east coast are for ARTCC air-to-ground communications. You might want to check in the latest Airport/Facility Directory in the section marked Air Route Traffic Control Centers.

Well, the bozo at the shack said I would have to use the coupon the NEXT time I came to a shack. RIGHT! Another coupla years.

Anyway, I donno if anyone has posted this yet, but a good use for the toy is to put it in your car for use with the handheld ham radio or scanner.

Now my wife gets to listen to both being fed through the car stereo at a lot louder level than the pico-speaker in the ICOM. She, uh, gives her, mmmm thoughts, to those of you that started this.....

2303. RS VOX Recorder on Sale

Newsgroup: rec.radio.scanner
Date: 1994-04-04 23:03:43 UTC
From: rflood@cis.umassd.edu
Message-ID: <CnrC2A.EFJ@umassd.edu>
Source record: 275861

I went by RS today and noticed that they had a VOX recorder on sale. It was the CTR-76 Model and they were selling it for $35 (regularly $50). It's kind of big, but it also has a remote mic jack that few VOX recorders seem to have. I decided to get it mainly for the remote mic jack that will work with the amplified speaker I bought a few months ago. I have seen a few posts about recorders lately and just thought I would fill people in.

Source record: 275862

RE: PRO2006 MOD
bobwx1@nbnet.nb.ca asks about a mod for a pro2006!

BOB:
The pro2006 is quite easy to modify. I think this mod was posted last week.
Anyway by removing the cover and look behind the keyboard (right behind
the #3 button) there are two diodes one restores the cellular and one speeds
up the scan rate to 30/cps. Clip the diodes and spread apart so they don't
touch. Put cover back on and you are done. Set search limits: example----
870.000mhz to 880.000mhz and search. Hit reset button and it searches in
30 khz steps (30 khz should come on the display) REAL EASY MOD!!

The pro2006 was on sale here in NOVA SCOTIA for 399.95 (regular 539.95)
in CANADIAN DOLLARS. I think the sale was over on April 2/94.

PS: the above mod does not restore 520.000--760.000mhz.

This past weekend in Arlington, VA. A pizza parlor employee calls in what he thought was an armed robbery. A few minutes after they dispatch a *ton* of very anxious police toward the store, the store manager calls to tell the police that it was all a prank. Apparently, one 17 year old store employee decided to enter with a ski-mask as a joke (I'm not sure if he actually said "stick 'em up" or what). Another employee who *had* been previously held up was able to sneak away and call the police.

The police decided not to arrest the kid, but did call his mommy down to the pizza store. They decided that they had put the fear of g-d in him, and left it at that. :-)

[much editing done]

Well, sometimes the PD isn't *that* bad about security. It's possible that they have some extra licensed (but normally unused) channels for such things as visits from special dignitaries. Sometimes these channels aren't even listed as being for the Police but are listed to the local government.

This is a great thread. If we continue with our list of dream scanner features (and someone listens) maybe we'll see some *really* cool, albeit expensive, equipment in a year or so. Here are some of mine off of the top of my head:

1) An activity alarm. I may want to program in a new frequency that I'm unsure if it's in use and I'd love to have an "alarm" that would go off when a certain channel shows some activity. That way I could go on with my normal monitoring, but still notice if one of my new channels shows some activity.

2) The data channel skip that Uniden has recently advertised. If it does what it sounds like it should, it would make trunked system monitoring much nicer.

well, that's it for now...

Peter:

The 2006 is one of the BEST scanners available today. If you are planning on 'clipping the diode', you better get one while there are available. You can get one from a franchise Radio Shack dealer, MaryMac. Contact Richard @ 800-231-3680. The last price I heard was $345. This includes UPS ground S&H. No tax, unless outside of Texas. This is a GREAT company.

The current model shipping is the 'a' version. This is a revision from the older model. They changed the 'light' control to a 'switch' - a GREAT improvement. I guess most people found they either had it all the way up (on) or all the way down (off). No other changes that I am aware of between the older version and the 'A'. If you buy own locally, and they don't have one in stock, they may try to sell you the demo (floor) model, which may have the dial instead of the switch.

what is the VOL switch setting used for in the transmitter module ?

I don't have the manual handy, but this is for selecting either an 'amplified' or 'non-amplified' output signal from your source. As an example, feeds from your stereo (via RCA connections) are not amplified. Feeds from an 'earphone' output, like a scanner' are amplified.

There is more info in the manual if you received one with your unit.

Antenna Specialists has a huge catalog of their commercial antennas including the same antennas the cellular companies use. Remember, you will pay commercial prices. I don't see why they wouldn't sell them to private parties (unless they know what you are going to use it for :-)

VH> Have you purchased a scanner only to find that it doesn't have
>all the features that are found in a similar product from another
>manufacturer? I propose to start a collection of ideas that list a
>desirable feature or a proposed enhancment to exisiting designs that will
>be listed here periodically.

Here are several that come to mind:

1. Multiple priority settings - as most scanners are currently set up, you have ONE priority channel. On some scanners it is channel 1, on others (RS) it is programmable to any ONE channel. My suggestion would be to have several priority channels, i.e. PRIORITY 1, PRIORITY 2, and PRIORITY 3. PRIORITY 1 is *THE* priority channel. it overrides any other channel when a signal is present. PRIORITY 2 would be second priority, in that it would override any other channel except PRIORITY 1 when a signal is present. And, PRIORITY 3 would override all channels except PRIORITY 1 and PRIORITY 2 when a signal is present. Also, if they could eliminate the "loss of signal" when a priority channel is being checked (you know, that little blank spot in a signal on a channel when the scanner checks the priority channel for a signal) that would be an improvement.

2. Alphanumeric displays - some models have them (I don't have any), but this should probably be a standard item. Don't know if I would use it, but I'd like to have it.

3. Digital clock - the Bearcat 250 had it, but I haven't seen it since. It would be nice to push a button on the scanner and see the time.

4. Built in CTCSS/PL capabilities - Apparently some newer model have this? I can see an advantage to this.

5. Built in DTMF decoder - I can think of several uses for this. I've seen add-ons, why not build it into the unit.

6. Programmable scanning speed - You want to scan 16 channels per second, you press "SPEED - 1 - 6 - ENTER" and you scan 16 channels per second.

7. Display off - You've got a hand held on your belt. Why use up your precious battery life by running an LCD display you can't see? Make a display off switch.

8. Remote control - I have my scanner right next to my recliner. But if it's across the room, why not a remote control (wireless) to operate the scanner? Maybe have the front of the scanner removable, so it turns into a remote control. If wireless is not possible, how about a hard wired

remote control?

When more ideas arrive, I'll post them.

The police dispatchers here in Blacksburg, Va. (population without Va. Tech students is less than 15,000) are pretty good--they are professional but can have their lighter moments also. Several of the banks have their alarm systems tied into the police department. The most common reason for an alarm to trip is forgetfullness on the part of a teller, who doesn't turn off the alarm before opening the cash drawer in the morning. The dispatcher will send the officers to "Bank alarm, B-7" (the banks are all numbered, rather than giving out a specific name or street address), the usually in a minute or two broadcast that "a bank employee will meet you at the back door; she is wearing a white blouse and a blue skirt." Several years ago, the call went out on Halloweeen morning for a bank alarm, with the quick "a bank employee will meet you" follow-up. The dispatcher was chuckling as she said, "she is dressed up as a bank robber!" The officer responding didn't see the humor in that, as he replied with a terse "Make sure she is not carrying any type of weapon when she comes out." I would have liked to have heard the chat the officer had with the bank manager after that incident.

Bruce

Well, for starters, how about putting the body of the message
in the body of the article, not in the title, and second, put the
title in the title, not in the body.

I'd sure say a buggy news reader.. anyway, for those who can't
read the body of the article, here it is..

Subject: Freqs. - PA & NJ State Police???
I know it's likely that this has been posted before but
could someone put the out there again?
Any truth to the rumor that Radio Shack is no longer
permitted to publish this information? Thanks in advance!

This article was probably generated by a buggy news reader.

----
well, first of all, I dunno where you got your information, but
if you look at police call, which I buy from radio shack,
(I'm looking at the 1994 version) I see plenty of
pennsylvania state pd frequencies, and plenty of
nj state pd frequencies. I would reccomend you look at the book
again.

FYI: First, information is free, so there would be no such
thing that they couldn't publish it. (correct me if I'm wrong)
and second, all (most all) of the njsp operations occur on the
800 trunking frequencies, except for a few (rare) ones which are
still MIRRORED on vhf or lo band. depending on where you are.

PSP haven't done a thing to their radios and I don't believe that
they have plans to change. look in the 155 band for PSP.

>I like the Alinco because of the scanning capabilities. Any suggestions?

I have an HTX-202. It's a solid, reliable rig at a good price. I understand the 404 is it's near-identical twin in UHF. If you're looking for a rig with extended reception capability, forget the RS HT's. Their front ends are intentionally quite narrow, to make them resistant to intermod. There are no mods to extend their frequency ranges because of this.

I have a Yaesu FT-530, which I use when I need extended reception capability.

Hope this helps,
Tom

d> Where can I get info on cellular mods for the Pro-46?

Product: Realistic PRO-46 by Radio Shack
Purpose: Restoration of full 800 Mhz coverage

The modification of this unit is from the May, 1993 issue of
Monitoring Times, published by Grove Enterprises.

** Disclaimer: All modifications are done at your own risk. This
product uses surface mount components which can be easily damaged.
Do not perform this modification if you are not experienced with
this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted
by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping
available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then
push upward on the bottom of the rear of the case, carefully
swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards
next to the interconnect plug in the lower right corner. Gently
pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. ** CAUTION!! Too much heat will damage the
shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder
and remove both.
6. Solder one chip jumper across the two upper most unused solder
pads. (Soldering a jumper across the lower two pads changes the
30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.

> stock, they may try to sell you the demo (floor) model, which may have the dial
> instead of the switch.

Not quite. They've never had a dial-type control there. What they had was a
switch labelled "dimmer" that changed the display backlight between two
brightness levels.

Btw, that display backlight is an electroluminescent panel, and Bill Cheek
reports that it *will* go dim over the years, eventually needing replacement.
Field replacement by a hobbyist is possible but a real devil of a job (a lot
tougher than clipping a diode). If you have a model with a "dimmer" switch,
use it on the "dim" setting whenever possible, as this will extend the life of
the EL unit.

The problems with the W2A are the limited (read none) sensitivity outside the
ham and public service bands and no wide FM mode. The 2SRA makes a much better
scanner than either the 580 (which I've owned) or the W2A...

Actually the 43-141 was discontinued a few months ago.

The newer version is I believe 43-143 and is a lot sleeker looking. Black keys, redesigned entirely.

Lots of users like that omission :>)

I agree. The Alinco DJ580T and Yaesu FT530 make good radios for those
who want both an HT and a scanner in a single unit. When you get mobile
with a whip antenna (5/8 wave) in bad areas of the city (high RF energy)
the intermod will make the wide band HT's useless. I own a 580 and have
seen the good and the bad.

In my car, I use a Yeasu FT2400. Best damned 2-meter mobile around!

I've owned the Alinco DJ-580, the Yaesu FT-470 and FT-530 and now own
a Standard C528A. The Standard is the nicest, most well built radio of
the 4. It has great audio, and lots of features. The only thing it's
lacking that I liked in the other radios are more memory channels (it
has 10 per band) and the FT-530 had a really nice battery voltage
meter you could enable when the subband was off.

DeltaComm has ads in the scan mags that say 1300 to 1800 scan per
minute (22 to 30 a second). Anybody know if this is a hardware or
software method?

The R-7100 User and Tech manuals fail to specify any rate at all.

2344. Frequency Counter

I recently purchased the RS frequency counter, and find it a very neat utility. Already used it to determine the frequency of several gizmos I've collected over the years!

I'm wondering if anyone out there has had any luck with using one in close proximity to a large trasmitting tower such as utilities and public service departments (police, fire, etc.) use. Is there any kind of directional antenna that could be attached to this thing to make it useful in the situation described.

Thanks!

Mike

I used some Motorola mobile radios in the San Jose Emergency Operation center that had this feature. It works very well. They have 3 priority levels. Motorola seems to do it in the background also which is the ONLY way to do it. There is no drop-out of the channel you are listening to, while it checks for activity.

The idea of using one in your car, espically in one of those states that squelch our rights to listen to what we want, is that you can hide your scanner and listen on your car stereo. Thus if you get stopped for whatever all you have to do is turn your car radio down and not worry about the " scanner police" giving you a hassell about your scanner. Not that I would ever actually advocate breaking the law, just some hypothetical thoughts.

Neil I saved this to the IDEA file I am collecting but may I add
some observations. LEDS eat batteries. My Alinco DJ580 has a beautiful
glowing green luminace with the 'LIGHT' switched on. It is quite plesant
IMHO to have clipped near the dash at night. The display is very readable.
The keyboard also lights up as on all the newer ham gear. I like the fact
that the light times out after a few UNLESS a sequence is used to force
it to stay on until commanded to go out. Does anyone know what technology
Alinco and others use for luminance?

Hopefully my new PRO-43 from Marymac will be here in a couple days, and then I'll be travelling to NY & NJ.

Any restrictions on mobile use in these states. I know there's a book you can buy about this, but since it's only two states and short notice I'd appreciate it if someone could tell me.

Thanks,

Jay

Hello Ken (?)
Actually I didn't write that...but am glad to see it happening. Mike has a
real nice 2 page St Louis area police dispatch grid which he has researched
and I have embellished with some graphics stuff. As I'm sure you know, Mike
pulled together a St Loouis meeting last year, and I'm glad to see this is
forming.
Mike's Address is: Mike Redman
PO Box 16673
St Louis, Mo 63015

Good luck to you all!

The front-end of the scanner should be wide enough so that being slightly off-frequency should not affect your ability to receive the traffic. At worst it should be a little distorted.

> When I try to enter frequency 860.052 which is ....

In the U.S., 860.052 is not a valid frequency. In this band the FCC assigns 860.x125, .x375, .x625 & .x875 (i.e. 25 kHz steps). Occasionally you'll come across the 12.5 kHz breaks (.x000, .x250, .x500 & .x750). Your Pro-43 accepts 12.5 kHz intervals and rounds anything else down. You might want to check the actual frequency the PD is using.

> Can you give me the part number for the service manual?

Replacement / repair parts for all Tandy products can be ordered from:

Tandy National Parts
900 E. Northside Dr.
Fort Worth TX 76102
(800) 442-2425

If you can't reach a U.S. '800' number, call (817) 870-5600. Give them the catalog number (20-144 for the Pro-2005) for the product and and ask for the service manual. They take plastic, deliver promptly, and are the best run division in Tandy (which may be damning with faint praise). You'll also skip the markup your local store may elect to charge.

When you turn in your Pro-43 for warranty service, the repair center should install the new version of the speaker. Radio Shack now has a 500mw speaker ($11 if you have to buy it) as a replacement for the 200mw one. The original part number was EAS-3P123A and the new one is supposed to be 127.

I have the same problem. The local police recently added a frequency
that none of my friends with pro-43 can receive. They are phasing
the old freq out.
The pro 43 rounds them off.
The new channel is in the 850 something range, all we can get is
bleed over, not very clear either.

Don't know what to tell you other then buy a scanner with selectable
channel spacing, because we can receive it on one friends scanner,
I think it is an AOR look a like.

Hi Again,

Well Im trying to get together another version of the Pocket Scanner
Book...

So far this is what's new:

1. More Cordless Mic Freqs
2. More National Shortwave Freqs (FBI,DEA,etc)
3. Presidential Freqs: (stuff when he travels)

So, once again I'm looking for more material to be put in...
Anything that can be used nationally (and hopefully worldly)...:-)

Also, I mentioned before that I was giving some thought to adding the
most commonly asked for mods to the PSB. Any thoughts on this?

I hope to have the PSB ver 2.0 done by next week sometime... This
will probably be the last version for a while I am graduating and don`t
know when I'll be back on the net...

2367. PRO-46 or other RS vs. another cheap Bearcat?

Newsgroup: rec.radio.scanner
Date: 1994-04-06 22:18:02 UTC
From: larry@cs.com
Message-ID: <1994Apr6.221802.20337@cs.com>
Source record: 275822

I'm trying to decide on another scanner to buy before the good ones %) start drying up. I'd really like to get a PRO-2006, but can't quite justify the $$$... I have a BC855XLT which is OK -- other than the well-known problem of it generating images of the local UHF TV stations, etc., smack in the middle of the "interesting" bands (you know, the ones we don't listen to %). So... I see a lot of references to how the RS scanners have much better selectivity and image rejection than the Uniden scanners. Is this only true for the top-of-the-line RS models (2006, 43), or in general? To be more specific, is the PRO-46 a better performer than, say, a BC200XLT or a BC855XLT? Do I have to get a 43 or a 2006 to get much better reception than my lowly 855? And are all the RS scanners made by GRE, or are some merely repackaged Unidens?

The 46 looks to be around $190 by mail order, whereas the 200XLT runs about $210 (the 855 cost $160). I'd pay the $20 extra just for 200 channels vs. 100 channels, but if the RF section of the 200XLT is no better than the 855, well... %(Are there any other candidates I should consider in the $200-250 price range?

>a new pack, and it works fine.
>
My R-4030 (same as 200XLT but made in Taiwan instead of Phillipines) had a
similar problem. I found that the springs on the battery contacts were weak,
and the connection to the battery was intermittantly coming off. Giving it
a whack or sliding the battery pack off and on again seemed to help. I finally
got sick of this and stretched the springs a little, and this seems to have
cured it.
As to not turning on with only the battery pack, I had this also- cured it by
sticking the plug in and out of the DC jack a few times. Not sure why this
worked, as it's not a closed-circuit jack (like the one that cuts off the
speaker when you plug in the ear phone) but I can't argue with results.

I have 2 battery packs, and the LED on the one that came with the set no
longer lights up when I plug in the adaptor- any suggestions?

2371. Beeper Dialer Interface

Newsgroup: rec.radio.scanner
Date: 1994-04-06 23:00:04 UTC
From: b1y1m39@kato.BELL-ATL.COM
Message-ID: <Cnv184.9n3@kato.BELL-ATL.COM>
Source record: 275676
Cross-posted to: misc.emerg-services,rec.radio.scanner

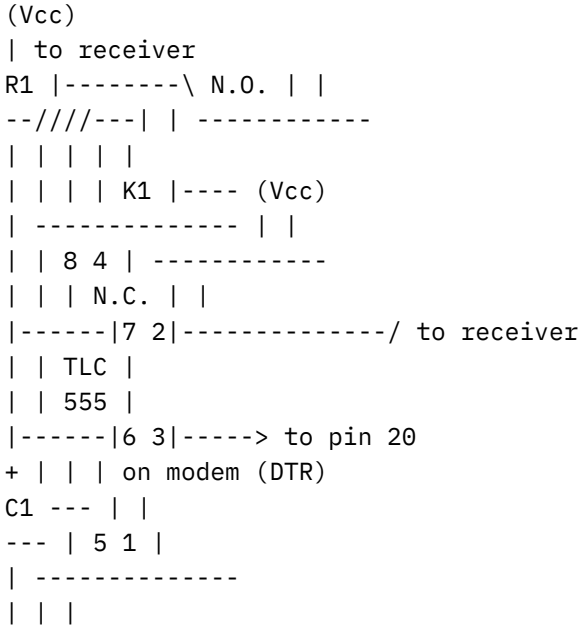
Have you ever been at a meeting where carrying your pager is inappropriate, but a digital beeper is not? And, as you sit there thinking "I wonder if my company had any calls today" you regret not wearing your pager because you missed that 5-alarmer? Well, here's a one night project that could keep you abreast of things....

As a company officer, I was issued a Plectron home receiver along with my pager and a portable radio. With the dust just collecting on the Plectron, and my need to travel at times for my regular job, I decided to design an interface between the receiver and my data modem.

Most modems provide a DTR dialing feature which dials the number programmed into memory location 0 or 1 when DTR goes high. The only problem is that DTR must remain high for the duration of the call. In steps the good old 555 timer.

By selecting a suitable R1-C1 combination, DTR will remain in a high state for approximately 50-60 seconds; more than enough time to dial and send information to a digital pager service. In fact, I subscribe to SkyTel's SkyPager service so I get beeped anywhere in the country!

All parts were brought from my local Radio Shack, including the general purpose PC board to mount and wire the components, a small plastic housing, and terminal strips for interconnecting wires. This was a lot of fun to build and I hope those of you that decide to use it, feel the same way....



```
| C2 --- |
| --- |
\--------|--------/
|
(Gnd)
```

Item Description Radio Shack No.

TLC555 Low power IC Timer 276-1718
R1 2.2M 271-061
C1 22 mfd Electrolytic, 35wv 272-1014
C2 .01 mfd ceramic or disc 272-1065
K1 5 volt SPDT realy 275-243

NOTES:
Vcc and Gnd must come from the modem. I found the +5 volt supply and ground and extended them to a 2-post terminal strip affixed to the modem with double-sided tape.

The connections to the Plectron receiver must provide approx. 5+ to energize the relay. If you need to know exactly where on the Plectron to make these connections, please replay via E-mail. The activation of the receiver causes a 1-3 second engagement of the K1 relay. But, since this is a 555 timer, it won't matter how long K1 is energized as long as R1-C1 is discharging (around 60 seconds).

If you power-down and power-up the modem, DTR will go high and remain high for 60 seconds. This is normal and will not cause the modem to dial (power-up cycle of the modem). If you don't want this to happen, just provide a momentary push-button switch between pin 8 and 4 of the TLC-555 so that Vcc is removed from pin 4 when the button is pushed.

3) I've heard about "Monitoring Times" and have checked four good sized bookstores but can't locate this publication. Is it the best one to get

Ken, check back at HRO, any radio hobbyist store should have MT, along with several other radio hobbyist magazines.
If your interested, I could send you info on the Bay Area Scanner Enthusiasts, a scanner club with a newsletter and a BBS.
My favorite 800 capable scanner is the Radio Shack PRO2006. Very easy to modify.

Does anyone have either

1) a schematic/pointers on creating a stand-alone DTMF decoder

or

2) the IC# of the decoder chip that the Novation AppleCAT][used?

The latter would be preferable, as I suspect it would be much
cheaper.

Thanks,

James

I'm working on a story for Common Cause Magazine on cel phone privacy. I'm looking for any stories you may have on cel phone snooping. John Gage has estimated that 60 - 80 percent of all cel calls in the Silicon Valley are taped. Any thoughts on this? Any good snooping anecdotes?

I will GUARANTEE your privacy (any level of anonymity you wish) when Iwrite this story. I don't want to jeopardize anyone's security or rightto privacy. I just want a good story. Feel free to email me directly.

Thanks alot.

Elliot

2376. BC200XLT Cellular mod?

Newsgroup: rec.radio.scanner
Date: 1994-04-07 00:11:32 UTC
From: jwa@pine.cse.nau.edu
Message-ID: <Cnv4J9.MLD@rainbow.cse.nau.edu>
Source record: 275681

I'd like to mod my BC200XLT for continuous coverage of the 800mhz
band. I pulled the mod file down from ftp.oakland.edu:/pub/hamradio/mods
and followed the instructions.. but, it seems my scanner uses surface-mount
components. How can I identify which resistor to clip? Maybe
a helpful diagram for incompetents like me would be nice :-)

Also, the chip was a 1447A and not a 1447 as described.. is there
any difference between the two?

Thanks,

James

From: hayden@krypton.mankato.msus.edu
Message-ID: <1994Apr6.203541.4264@vax1.mankato.msus.edu>
Source record: 275683

I'm going to be buying my first scanner in the next week or so, and I picked up a copy of Popular Communications to look at the adds and see what mail-order prices were like.

One of the scanners that stuck out as having oodles of features for a decent prices was the Bearcat 2500XLT-H handheld. It scans a wide-range and says it is cell-modifyable. Furthermore, "Communications Electronics Inc." has a deal going where you can get it fro 314.95 if you mail in your order with a $25.00 off coupon.

Does anyone have any expierience with either this company or this scanner. And if either are bad, can you recommend somethign better? I'd like not to spend more than about $350 for a scanner, and would prefer closer to $300. Main monitoring will be police and campus security, but i figure that someday I may want it all, so the more range and features, the better.

Source record: 275684

I would like to determine whether or not there is sufficient interest to warrant trying to start a notification service in the Greater Rochester, NY area. If you would like to be involved in such a group, and if you live within 50 miles or so of Rochester, please contact me. My Internet and Fidonet addresses are in the signature block below. Please don't flood the newsgroups with local replies.

If you cannot send email via Fido or Internet, then please call my home number and (probably) leave a message. (716) 254-1726.

I am hoping to attract hobbyists, emergency preparedness volunteers (and career people), news reporters and other parties who could make use of a service that would alert for major events only. I'm also looking for folks who would volunteer to do the alerting so we could cover as much of the clock as possible.

The proposed name for the service is Finger Lakes Alert Group (FLAG). I also envision some meetings for a club-like operation if folks are interested in that. If I get enough responses, I will plan a meeting.

> OK, how abouit a good list of the refuleing freqs. ???

You can't get any better then THE official source, the DoD Flight Information Publication "AP/1B - Area Planning Military Training Routes - North and South America." But the quickest way to get a list is to go to Radio Shack and buy the Aeronautical Frequency Directory. It has a map of AR's (air refueling routes) over the continental US and a listing of AR freqs by AR.

And if you can't wait long enough to get to RS try AR-016 (the AR closest to Purdue - I assume you're at/near Purdue). AR-016's primary air-air is 343.500, secondary 319.700. Entrance and exit freqs (depending upon direction of flight) are 362.300 and 353.800. All freqs are AM mode. AR-016 runs from the IN/IL state line to a point in northwest MO.

For those of you who are interested in the Radio Shack hand helds I just ordered one from Marymac Industries in Katy (Huston) Texas. They have the HTX-202 for $169.95 and the HTX-404 for 209.95 both included shipping. I have bought several Radio Shack Color Computers and one scanner from Marymac and have had good luck with them. You can get any scanner the shack sells for 15% off the catalog price and they pay the shipping. Not a bad deal.

2383. Re: Decoding Alpha Numeric Pagers

Newsgroup: rec.radio.scanner
Date: 1994-04-07 04:55:24 UTC
From: mfraser@vanbc.wimsey.com
Message-ID: <2o03ns$2mi@vanbc.wimsey.com>
Source record: 275688

You will find that pagers virtually all use "direct FM"; the carrier of
the transmitter is bashed to the plus and minus deviation rails for
mark and space bits. POCSAG, equivalent to CCIR Radio Paging Code #1
is 512 bps; more recent versions go to 1200 bps. Motorola's Golay Sequential
Code (GSC) is a 600bps (text) plus 300bps (everything else) code, but
a little more like a Reed Solomon Code, with error control bits
scattered through the message, rather than hung on the end as in POCSAG
which is really a basic BCH code.

Audibly, if you should be forced to listen to a scanner (careful not to
repeat anythinbg your ear decodes) you will easily hear the difference between
the two types and rates. Both have a preamble - POCSAG of 512 bits more or
less (a second). The 2 data rates used in GSC are also quite audible, and
are THE characteristic of the code.

In Europe, ERMES and relatives plan (are using) to use a higher speed
(5Kbps? higher? I forgot) method; most opinions run toward evil
non-tariff barriers to trade as teh reasons for this. No comment.

Was it the Universal decoder unit that decodes alpha paging? Check
with Universal Radio or Grove for details. Someone will have the
phone number, or check Monitoring Times or Popular Communications at
your (technical) news-stand.

Those nasty europeans also have generated another box to decode paging.
I have no more info, than the company name 'Hacktic'. Banned in
the U.S. i hear.

Cheers / Mark

The BC-200XLT does this. Although the priority channels are not
programmable, the first channel of each bank is a priority
channel. If all ten banks are turned on, you can see it stop
scanning the main channels and scan the ten priority channels,
then resume scanning the main channels.

Hi all,

Well I called Tandy National Parts and they don't make a technical manual for the Silent Play TX-RX stereo units. It's basically a break and throw away item. So it's back to good ol' reverse engineering for this device. I figured it was worth a try anyway.

I agree,as far as using the off position unless you really need to have the light,but changing the EL panel is a VERY simple job!It only takes a couple of minutes.The hardest part is getting the "goo" that GRE uses to hold the panel in place.I have done this repair on a half dozen 200X's.

WOW give Per H. Nielsen a gold medal! I have given alot of
thought to the ULTIMATE SCANNER and I never would have thought of this
very practical IDEA! The problem he addresses is one that has bugged me
for years. It goes to the top of the list I am compiling!

Good going Per!

John Quill Taylor could we ask you what the remote 'button' is
supposed to do? What benefit would it have? Seems to me that 'this wire
under your pillow' may easily damage a connected device as you toss and
turn in your sleep (IMHO).

John your HP graphic is really neat on the INTERNET when looking
at your post. Simple but neat!

Vic Healey
vhealey@crl.com

PS By the way try to preface ideas about the ULTIMATE SCANNER with the
key word IDEA in subject header. This makes it somewhat easier to scan
and select for saving the ideas being submited to our INTERNET IDEA list.

I almost missed your post when casually scanning the subject list of this
USENET group.

I'm not sure if this post belongs on rec.radio.scanner, but other
than sci.geo.meteorology, I'm not sure where else exactly to put it.
While listening to our local NOAA station in Chesterland, Ohio last
night (KHB59, 162.55) [we got yet another winter storm yesterday
evening :-( ] they announced a (new?) 1-900 number service. No,
not that kind!

The number is 1-900-884-6622, you need a touch-tone phone, and it
costs 98 cents per minute. You are given a menu, and you must enter
either the area code or the 4-digit station code (anyone have a list
of these?) and they patch you into the local NOAA station for the weather.
If you punch in "88", it gives you the WWV UTC time broadcast. I
tried a few area codes at random (406, 307, 812, 317) for which the
service did not provide coverage. Coverage was there for 216 and 419
in Ohio, 219 in Indiana, and 408 and 805 in California.

No problem in NJ.

NY does not allow radios that can receive police in mobiles, but the
law does have an amateur license exemption (so you need not worry if
you are a ham).

2403. Tweek & Calibrate Silent Play freqs!

Newsgroup: rec.radio.scanner
Date: 1994-04-07 14:51:58 UTC
From: mike@garfield.csuohio.edu
Message-ID: <1994Apr7.145158.28926@news.csuohio.edu>
Source record: 275703

I was fiddling with my Silent Play transmitter last nite and noticed that when I ran it through my RS RF frequency counter, it had a transmit freq range of 85.5 - 90MHz. This seemed strange since it's advertised as 89 - 93MHz (as well as it being outside FCC specs). I also verified at least the top 90MHz limit by tuning it into a digital frequency display FM receiver.

So, I discovered a way to crudely re-calibrate the frequency range of this device to get it back into specs.

1. Take the case off (two small black Phillips screws). Be careful of the two plastic molded-in tabs on the opposite edge. You have to twist the case a little, but don't break the tabs.

2. Remove the screw holding the circuit board (near same edge of case as the two plastic tabs). Be gentle with the antenna connection since the wire is glued to the case and then soldered to the board. It flops around while you handle the board.

3. Hold the circuit board with components facing you, oriented so the circuit board looks like a capital "P". The 1/8" stereo plug will be at the top, the two slide switches will be on the left edge.

4. At the very top right corner, just to the right of the slim LED and above a small capacitor, you will see a wound copper air-core inductor (it looks like a copper spring).

[At this point, I solved the mystery of why the tuning was out of whack on the transmitter: When I opened the case when I FIRST got the unit (to explore!), I noticed the coils of this inductor were bent, i.e., a few coils were pushed apart, as if done with a fingernail. I though I had done it myself accidentally when taking the thing apart, so naturally I pressed all the coils back together again. Mistake!!!]

5. It turns out that carefully bending the coils together and apart is what provides the calibration of the tuning range. There are no adjustable inductors anywhere to be seen, so this must be how they calibrate the unit at the factory. Anyway, I simply re-bent the coils apart and played with the tuning knob and bending some more until I got it back to the range 89-93MHz by watching my RF freq counter. It was pretty easy. If you don't have a RF freq counter, you could easily do it by tuning an FM receiver with a digital display (like one in your car), while the Silent Play is transmitting, while bending the inductor coils. Do a little at a

time.

Perhaps with some hacking, you could replace that simple inductor with an adjustable one to see how far you can shift the frequency range. I'm not gonna do this type of mod, but I did discover by waving my hand near the circuit board, I was able to get the thing to jump to around 150MHz in spurts, but who knows exactly what components were affected by my hand to make it do this (there are some ferrite core inductors too). This gizmo probably has little use outside the FM broadcast band anyway (unless you wanted to perhaps retune it up to the 2M ham band for some reason).

I also noticed that when I put the plastic cover between my hand and the circuit board, the freq remained stable again (maybe the plastic is impregnated with something conductive to shield the circuits from inductive/capacitive coupling from one's hand??)

6. When you put the cover back on, make sure the plastic fingers on the two slide switches seat properly back into their respective plastic finger-slides.

Another nifty hint:

The transmitter normally draws about 9 mA of current. I removed the silly LED and it dropped to just under 6 mA current draw, and did not affect performance or frequency. This could be useful not only in extending xmit time on one set of batts, but make it even easier to run the thing off solar cells if you're so inclined.

FYI, the receiver unit draws about 15 - 20 mA, depending on if the stereo LED is lit and the volume setting. I did get it to jump to a whopping 80 mA when I pulled the earphone plug out of the receiver half way - it must short the audio amplifier across one of the plug conductors causing it to pull full current thru the amp.

Hacking for no apparent reason,

Mike

The 1994 ARRL handbook has a very simple decoder (two IC's) that
I could probably even put together. ...haven't tried yet but it
looks straight forward. To get a feel for how simple it is, it has
four LEDs from which the 16 tone pairs can be deduced. Pretty low
level...

My guess is that this 60 - 80% number is WAY TOO HIGH. Tracking is not simple. There are thousands of calls everyday (probably tens of thousands) in Silicon Valley. If someone has tracking equipment they can select the phone numbers they want to track they would not waste their time on the "I'll be home in 10 minutes" type calls. Cell phones are not private, and they won't be until they go digital. Law or no law, cell phone users need to be told that their conversations are not secure. I remember listening to a guy on cellular (before the law was passed, of course) talking about how it was too difficult to monitor a cell call because there were so many channels. I just hit the search button each time he moved cells and in a few seconds there he was again.

(text truncated)
m> So, I whip out the calculator and sure enough,
m> 154.935 - 21.4 (2*10.7 IF) = 133.535 lands me right in the
m> AM Air band. Three questions:

m> 1. What does an AM transmission sound like on FM? Garbled?

It does sound kind of garbled, almost off frequency sounding. You
will know there is a voice there but it isn't very clear.

m> 2. What is the likelihood that an AM image will show up and
m> break squelch on an FM band 21.4MHz above?

Depends on your scanner. I have a Bearcat 210XL and Bearcat 160 scanner
and both of them will pick up images of aircraft on 155.1000.

m> 3. 133.535 MHz I do not recognize as any frequency being used
m> by either Cleveland Hopkins or Akron/Canton airports. Does not
m> show up anywhere in Police Call. (which really did not surprise me)
m> Any insight from anyone?

Hmmm....it may not necessarily be for an airport. Several air carriers
have freqs to communicate with air crew on the ground that is for their
compnay. You will see these at the back of the Police Call book...usually
in the 130 range. I suspect that this is not a complete listing, though.

.....
When I moved into my cuurent home the previous folks had gotten Cable, I to utilize Cable. However the previous owner had put up a VHF/UHF TV antenna before cable came to the area. Although these are really designed for the tv frequencies (60?-88?, 170?-220?,512-800?) it is still MUCH better than the rubber duck on my Pro43. All i needed was 300 to 75 ohm converter and a F connector to BNC adapter (both are cheap and available at the Rat Shack) I pick up stuff at better than 75 miles away (NOAA) 2 meter repeaters (50+ miles) simple test to switch back to the duck and I don't get the same signals (helps that the TV antenna is up on the roof!!) This could be a cheap solution. Keep in mind I have cable so this antenna is defunct. I use mine exclusivly for my scanner.
OPINION: Since TV's and Scanners are rx only devices they should share this antenna feed with no problem.(previous owner had 4 tvs hooked to this antenna!)
DISCLAIMER: I not saying you can't damage your equipment and I assume no liablity for the above statement since it is my opinion only.

Basic DTMF decoder chips are widely available, but using them with
just LEDs is a pain - next to impossible for decoding autodialed
numbers.

The chips I've used have a 4-line bus (with optional Valid Pair
output and handshaking). It's not too difficult to connect such
chips to a PC parallel port.

I suspect that this 900 number is not "sponcered" by NOAA. It is probably a private company "entrepreneur" trying to sell information that is normally provided free of charge (via tax dollars) to the public. I suppose one could argue that they provide a service to people without access weather radios, television, broadcast band radios, or news papers. (Let see now, that leaves about six people who live in Arkansas, and they don't even have a telephone!) :-)

Cheers,
Steve.

I was wondering if anyone could email/post the general FCC rules
regarding two way/field programmabe radios including licensure, range,
etc. I know this is alot to ask, and a fairly general topic, but I don't
really have any specific questions to ask. THANKS!

On the other hand, there are thousands of undamaged PRO-43s out there.
I think Radio Shack has an excellent track record with their scanners,
reliability wise. Stuff breaks. That's what guarantees are for. I
don't think it's fair to single out Radio Shack. When you sell as many
scanners as they do, you're bound to have a few problems. At least you
can take it back to ANY store for refund/replacement/repair.

Regards,

Jim

2416. Digital!!Scanners obsolite?

Newsgroup: rec.radio.scanner
Date: 1994-04-07 18:53:16 UTC
From: ckf@christa.unh.edu
Message-ID: <2o1kqs$nbq@mozz.unh.edu>

I heard a rumor that technology may see a major advancement to more sophisicated types of broadcasting because of the mess of regular MHz bands out there now. All the bands the FCC can offer are almost filled. This has promted a major research project in the use of "digital" broadcasting. Is this all true/accurate? What will this mean for the scanner world? Just thought I wold raise a topic.

From: dkolson@purple.ics.uci.edu
Message-ID: <2o1mi5$1tn@purple.ics.uci.edu>
Source record: 275716

Hi all,

I have the Bearcat scanner that has 100 channel memory (I forget the model # now). Anyway, it worked fine one day, then the next it wouldn't do anything. So I charged the battery---still nothing. Then I noticed that if I sort of pushed the antenna firmly (near the base where it connects to the scanner) the radio came on if the power switch was on.

Well, I thought that a loose connection was all that was the problem so I decided to open it. Well, now it doesn't work at all. I didn't touch anything, just removed the backing. Argh!!!

Here are two questions for you:

1) Has anyone else experienced this problem with their scanner not working?

2) Is it necessary to send it back to Bearcat to get it fixed, or is there possibly a place here in So. Cal. that can take a look at it?

Cya,
David
P.S. My scanner is just about a year old. If that matters...

We have a piece of equipment that seems to be having some RFI problems with something around 923 MHZ. Anyone have any ideas what this could be? I used a spectrum analyzer to look at the signal. It is intermittant and seems to be modulated at least 500 Khz. Anyone have any ideas what type of device could be generating this?

What type of antenna are you using? If its an external one, sometimes moisture
can get into the coax connections, and noticeably degrade performance at higher
freqs. Also, during the spring, I notice a drop in reception on 800Mhz due to
the leaves on the trees absorbing the radiation at those higher freqs.

2420. Chapter 90 violation (last chapter)

Newsgroup: rec.radio.scanner
Date: 1994-04-07 20:28:24 UTC
From: wmeranda@vnet.ibm.com
Message-ID: <CnwovC.tCL@sernews.raleigh.ibm.com>
Source record: 275719
Cross-posted to: rec.radio.scanner,alt.radio.scanner

A while back I asked if anyone knew what Raleigh NC police were referring to when they had 'a possible chapter 90 violation'. Many people posted that the reference was to possible violation of state/local drug laws, and some suggested that the local library could confirm that.

I felt obligated to follow up on that tip since I should have had enough sense to think of it myself. Can't guarantee this is interesting to anyone but me:

Chapter 90 0f the General Statues of North Carolina cover lots of areas that appear to deal with personal safety <guess you could claim that about most laws>. Article 5 of chapter 90 is the NC Controlled Substances Act. It lists all controlled substances and categorizes them into six "schedules" or categories according to their danger. An example of a Schedule 1 (very dangerous) substance is Benzine, Schedule 2 consists of many street drugs like cocaine and heroin, on down to schedule 6 which contain drugs with 'no medical use - low risk' like marijuana. Article 5 also covers the violations (possession, selling, manufacture etc.) and their associated penalties.

Another article (5B) covers the same things for drug paraphernalia (seeds,scales,pipes...).

Thanks for the help.

: John Quill Taylor could we ask you what the remote 'button' is
: supposed to do? What benefit would it have? Seems to me that 'this wire
: under your pillow' may easily damage a connected device as you toss and
: turn in your sleep (IMHO).

I should clarify: On my Pro 39, the SCAN button has been used so much that it is about worn out. Sometimes it doesn't even work - maybe the contacts are dirty. Anyway, if you don't like the freq you're listening to, you have to press the SCAN button, and in the dark or in the car this is a frustrating task. Why not have a remote button (maybe hook it up to one of the buttons on the streering wheel!) to cause the scan to occur. That way you would not have to picj up the radio and hit the SCAN button. Instead of reaching over in the dark to press scan over and over, you could just hold the push-button. Maybe put PRIority on it too. Maybe we need a mouse port......

If you read most of the amateur exemptions closely, you will find that they are worded such that an amateur is allowed to operate amateur equipment which is capable of out-of-band reception. This does not necessarily allow a ham to legally carry a scanner. Most cops probably wouldn't worry about (or know about) that distinction - but be aware that being a licensed amateur does not necessarily make you scanner legal in all 50 states. It is still a reasonable precaution (and a related fun hobby)....

Your tax dollars did not, however, cover the expense of providing phone
access to this information. Government agencies sell information, but
they are only allowed to recoup the cost of providing that information.

Lessee, the operations budget of the National Weather Service,
excluding capital for satellites and radars, is roughly $250 million.
That is $1 per person per year. Make that your tax dollar, singular,
and write your Congressman extolling the value you've gotten for
your dollar. Or you could ask for a free minute on the Weather Channel's
1-900-WEATHER, keep the change.

Anyone have any problem with programming the "step" value when using search range 9 ?? I seem to be unable to enter anything and get it to store for only this one range. I have tried the same frequencies in other search ranges with success, but using the identical entries in range 9 does not work.
Is there anything special about any of the ranges or banks ???

By the way, "2ndF", "STEP" (which displays "TONE") seems to do a HOLD function for scanning, much like the "DLY/HLD" does for the searching.

I've found the freq for some low power HT's at about 10-20 yards away, but never have used it on a repeater. For the money, it's not a bad deal at all. I live fairly close to a FM broadcast transmitter, and if I'm in the right place _inside_ the house, it will lock onto 105.500 Mhz. A preselector/amplifier would make such a device much more valuable, but the only I know of is made by Opto and is VERY expensive (around $900! I think).

Alot of times you can only hear one side of a celllular conversation because the call occurs between a long distance carier. Like if you call another state on your car phone most probably you could only listen with a scanner to one side of the call.

[stuff deleted]

I did the same thing with my parents log peroidic VHF-UHF antenna. Another enhancement you might try is to mount the antenna vertically (on its side). This will make the antenna vertically polarized, and should help even further, as most VHF-UHF transmitters utilize (of course there is exceptions) vertical polarization. This should reclaim the loss you are currently getting by using the opposite polarization. And yes, this is an extremely cost efficient beam! If a person doesn't already have one, sometimes you can find a neighbor who doesn't use the outdoor antenna anymore, and sometimes will be even glad to get rid of it! It's worth a try!

After getting a hair cut, I was walking to my car when I saw a blind man walking along the sidewalk talking into a radio. It was turned up so loud I could hear the conversation going on: about three people (including the blind man I was watching) were conversing as if they were on a police--dispatch frequency. The blind man (who was using a walking-stick, etc) asked for a physical description of the "subject". The description was given (unfortunately I was too far at this point to hear it) and the conversation continued. I got into my car, circled around, and pulled along the sidewalk beside the man. I asked him out of curiousity what frequency he was on. He told the woman he was talking to on the radio that he would "call her back" and asked me if I was using a CB, or what. I told him, "no, just a radio." At this point, the man is moving his head and repositioning himself in what seemed like an attempt to focus in on me. There was something visably wrong with his eyes. "Oh, well I'm on UHF, sorry," the blind man says. I realize the misunderstanding and explain that I have a scanner, not a car radio, etc. He mumbles something about being in the 800 range. I ask again if he would mind telling me what frequency he was using or if he would rather keep it to himself. He told me he would rather keep it to himself. I thanked him and drove away. When I was out of sight I pulled over and scanned the frequencies between 806.0 and 830.0. I didn't pick up anything. Perhaps I should have continued looking. If this guy was undercover, he was doing a damn good job. He seemed genuinly blind, his radio was obvious and blasting and he seemed a bit mentally abnormal. Does anyone have any idea on what this guy might have been doing, or what frequency he was using? It was definately a radio, not a phone of any sort. The antenna was a rubber duckie about a foot long.

Alex Chernyakov.

I got my PRO-43 late '92 just after it came out (S/N <1500), and have noticed a significant loss in keyboard responsiveness. I'm going to replace the rubber membrane keyboard (the L/O key is almost totally gone due to an accident), but I'm not sure that is going to give the nice responsiveness it once had. Should I get the PCB underneath the keyboard replaced too? I've made some mods to the unit before so I'm not afraid to get my hands dirty. I think I'm gonna get the 500ma speaker too, has anybody noticed a significant difference with it?

Serious fire buffs and monitoring enthusiasts have purchased the motorola
or ge radios and have had them programed for the proper talk groups
within the trunk system. These folks have always been part of a
notification system of some type. Many freelance news and television
photographers have had business repeaters or pagers for notification.

In san francisco and new york city these freelance news notification
networks operate on -trunked- repeaters as well as display pagers.

From what I understand there are already a few organizations out there using digital equipment. The number is bound to increase. I don't see it as a problem, as long as some standard is adopted. The problem that we have now with digital protocols is there are no standards - everyone is using their own proprietary protocols. If the industry establishes a digital transmission standard used by all manufacturers, scanners will be available that can receive them (assuming the transmission is not encrypted). If they don't and every manufacturer has their own patented, proprietary standard, then it will be illegal for scanner manufacturers to make digital scanners until the patents run out. (This is what happened in the early days of trunking. Some small company in CA built and started marketing a trunking decoder. He was quickly threatened with legal action for patent infriengement and forced out of business.) For the life of me I can't understand anyone investing millions of dollars in a communications system that becomes a worthless pile of junk if the company goes under!

Well, on the bright side, it will take years for all these small companies to switch over and for FM to disappear.

For a couple of years now I have been using Scanner Buff, a data base
shareware program by BoB Ricci. For the most part it works pretty well and
has some good features. However there are a few bugs still in the system and
BoB has droped out of sight (or at least I no longer know how to get in
toutch with him).
My questions are: 1- does anyone know of another data base program
for pc that is designed for scanners or; 2- does any one know how to get in
toutch with Bob Ricci?
If you have answers to either of these questions please email me at
cjs9@cornell.edu

You might of course add that we know it recieves cellular after
cutting a wire. No trx possible in the high UHF band though as you
stated. A phone patch on 2m or 70 cm was what he noticed for the outgoing
call. Since it has an autodialer like most ham sets do now it would
appear that one was making a regular call. The voice id's before and
after the conversation would be the give away as to ham use.

Most of the new ham handhelds are very slick by scanner standards.
Why can't the ULTIMATE SCANNER have almost all of their features?
IMHO the ULTIMATE SCANNER would be also able to transmit also!

If the HT antenna got narrow at the top 4 inches, then it was an 800MHz system, otherwise it was probably 155 range.

From: mulligan@ACM.ORG
Message-ID: <2o3n0h$263@hopper.acm.org>
Source record: 275755

The PCB just has the conductive pattern printed on it and doesn't contribute to the responsiveness of the keyboard (it also has the CPU and would cost a bunch). The membrane is easily replaced - remove the first two boards as in the diode mod, then remove the logic board and the keypad is just sitting there. It cost $3.89 from Natl Parts a year ago (manf. part nbr GE-91C-9212, "Key, Top").
The lock-out switch is a separate part (GE-91D-9211, "Knob, Key Lock").
Preliminary reports on the 500 ma speaker are that the sound is slightly improved, albeit the volume is a little lower. It's approx. $11 and the part nbr is reported as EAS-3P127A (the original one was 123A).

It could be an amateur transmitter, or it could be the military. Hams
have secondary privlidges on 902-928. Where are you located? If your
close to a military installation, that could be a big hint.
Does your place have a microwave oven or is there one nearby? Older
microwaves used the 900 MHz band.
Or maybe someone's cellular phone isn't as good as new.

In most cases, elimination of the interferance will be your responsibility.

Good Luck,
Galen, KF0YJ

This is reprinted (without permission) from the latest Natinal Scanning Report (a Bearcat Radio Club publication for those unfamiliar). It has to do with more cordless phone frequencies. Thought I'd pass it along.

More Cordless Phone Frequencies

Citing congestion on the nation's millions of cordless phones, the FCC is proposing the addition of new frequencies. The original cordless phones operated just above the AM broadcast band between 1600 and 1800 kHz. Later, they were assigned to the 46 and 49 MHz frequencies commonly in use today. Now, if things go as planned, you'll be able to tune in the phones on the 43, 44, and 48 MHz bands as well. Here's the proposed numbers:

base	handset	base	handset
43.72	48.76	44.18	49.20
43.74	48.84	44.20	49.24
43.82	48.86	44.32	49.28
43.84	48.92	44.36	49.36
43.92	49.02	44.40	49.40
43.96	49.08	44.46	49.46
44.12	49.10	44.48	49.50

BONG-Sorry Vic, I know what he wants, for whatever purposes he didn't state. And if YOU'LL follow alt.2600 you'll find some of my posts referring to the fact some time ago on the introduction from Rat Shack with the new dialer as a replacement for the older model. And BONG AGAIN-if YOU'LL follow that newsgroup you'll see (as I've stated many times already) that the new dialer CAN INDEED be modified. Already did/done that! Maybe you need to get caught up on alt.2600's news postings? By the way...the new dialer is designed with a black case, pearl colored keys, and has a newer ergonomics design to it. And just as easily mod'd as the original. Go figure.

Al

2462. Modem throughput with Analog Cellular

Newsgroup: rec.radio.scanner
Date: 1994-04-08 18:56:40 UTC
From: kevin jessup <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1994Apr8.185640.3382@mixcom.mixcom.com>
Source record: 275769
Cross-posted to: rec.radio.amateur.misc,rec.radio.scanner

A question for anyone running an analog V.32bis modem (14,1400 baud)
into an analog cellular phone.

What is the effective baud rate when all is said and done?
Does your file transfer protocol indicate many errors?

I am considering a PCMCIA 14,400 baud modem for my palmtop
that will then connect to my analog cellular phone. I don't
want to waste money on the high speed modem if effective
throughput is 2400 baud or less. Thanks.

2463. FINALLY: A Software Touch-Tone Decoder (DTMF) (Mac)

Newsgroup: rec.radio.scanner
Date: 1994-04-08 19:53:42 UTC
From: John_Coggi@qm_smtp.aero.org
Message-ID: <John_Coggi-080494123943@ldef.aero.org>
Source record: 275644

For snoopy scanner bugs with a Mac (and built-in microphone), there is now shareware available to decode touch-tones in real time. (Hmmm, now why would you want to do that?). I happened to come across it whilst innocently browsing the ftp site sumex-aim.stanford.edu in the /info-mac/snd/util folder (I think that's where it was). It's a demo version so 3 tones will not be recognized. You get the un-crippled version for $25. Performs pretty well when I placed my PRO-46 near my LC's mic and dialed some numbers on my cordless phone, although it sometimes gives false-positives when I talked. Can also detect Ring, Dial Tone, and Busy signals. You can paste a pre-digitized sound into it and have it decode it for tones, too. Neato. (BTW, there are hardware decoder units available which plug into your ear plug jack. They cost ~$150 - $200, though).

The Bearcat BC100XLT has this feature. It has ten banks of ten channels, and the first channel in each bank is a priority channel. It comes in real helpful, when I want to listen to the local city police, state police, and another local city police. I'm sure the BC200XLT has the same feature with ten banks of 20 channels.
My .02 worth.

2468. PRO-43 Question

Newsgroup: rec.radio.scanner
Date: 1994-04-08 22:22:44 UTC
From: daveg@stpaul.ncr.com
Message-ID: <daveg.1@stpaul.ncr.com>
Source record: 275772

This is my first posting to this news group. I have enjoyed reading the articles in this group. My thanks to all of you for the information that has been posted here.

I have a Realistic PRO-43 and have noticed the following problem when scanning in the 162 to 168 government frequencies range.
Some of the government frequencies are in .0025 MHz steps (example 163.3875 for a local Air Force Reserve security frequency). When this frequency is programmed into the PRO-43, it rounds the frequency down to 163.385. The user manual says that the frequency step for 162-168 MHz is .005 MHz (163.385, 163.390, not 163.3875).

I noticed that the 163.3875 frequency can be received on 163.385.

Has anyone else encountered this problem ? Are there any recommendations ?

>the internet or anywhere without paying for it.

Henry:
I don't know if this 900 number is from NOAA or not, but lets assume it is. I can almost bet the farm that it would be a "User Fee" in which NOAA would recoup their cost for providing the phone service. User Fees are become more and more visible when the Gov't provides services. Most National parks have a fee, boaters will be paying a fee, even some of the museums in Washington have a box for "donations", a voluntary user fee. With the budget being cut for NOAA and other Gov't agencies you will be seeing a lot more user fees. It's not nice, but it's to be expected.

2475. Pro-43 vs. Pro-2006

Newsgroup: rec.radio.scanner
Date: 1994-04-09 04:22:49 UTC
From: holmanji@ohsu.edu
Message-ID: <1994Apr9.042249.12426@ohsu.edu>
Source record: 275630

I'm thinking about getting either a Pro-43 or a Pro-2006. Other than the obvious differences (base vs. portable, etc.) are there any features which would weigh in favor of one or the other? I noticed, for example, that the Pro-2006 covers some frequency ranges which the -43 does not. But is there anything in these other ranges worth listening to?

Any comments will be very welcome. I'm a complete stranger to all this!

Jim Holman holmanji@ohsu.edu

I'm not sure I believe you when you claim private security firms would have handled it better than the SS. Bill Gates' wedding was the first time I've ever seen private security successfully handle the problem of media helicopters. Its just plain tough to make the media do what you want them to do, and most of the time you don't have the advantage of being on an isolated island.

I don't know why the SS (if it was in fact the SS, sometimes the SS gets blamed for the stupidity of others) told the media copter to stop broadcasting the current motorcade position. Heck, while in St. Louis, the position of the motorcade is broadcast in the clear by the SS as they coordinate street closings with various local police departments (St. Louis has very balkanized local government, 100+ different municpalities with their own police). A presidential motorcade is just too damn big and noisy to pretend its a secret. Its like Trident submarines setting out to sea for its tour of duty. The navy assumes that every person on shore, satallite in the sky, and spy is watching the port. So they don't attempt to sneak out, instead it is a big public event. The stealth of the submarine doesn't depend on the public on shore keeping a secret. Nor would I expect the security of the presidential motorcade to be dependent on the media keeping its route a secret. Of course, not everything is as it seems to be. If the "enemy" gets used to submarines sailing in broad daylight, it makes it easier to sneak out when you want too. [Re: News stories about the Clintons leaving the White House for an evening without the press knowing.]

P.S. Title 10 doesn't overrule the U.S. Consititution.

I agree that there is a lack of true protection for vips. I live near a miltary base and the vip's use it in visiting. After listening to various services and just plain using ones intellect I have pieced together far more then anyone should know about vip security. In the wrong hands this could be deadly. I am gald I am not a vip and not in charge of their security as I believe it largely is an illusion. Now if I could do it as a hobby what is stopping the flakes from hostile powers and religious cults (Muslim) from truely making a mark on history by knocking out some of there folks? IMHO very little.
Vips can be tracked on HF as well as VHF and UHF by any radio amature who is inclined. Too many additional agencies transmit information regarding their involvement in security. If part of one is encoded or uses cryptic words, another reveals the meaning by transmitting missing information in the clear which then reveals the meanig an intent of the cryptic transmissions.
Look at what happened in Rwanda. How did those folks know who was on that plane? And that is the third world! Most of the folks that hate US vips are far more educated and have access to far more advanced technology. IMHO those charge with providing security have been very lucky to date. If they don't pay attention to items such as this their luck may run out. My advice to those in the industry is also to do the unexpected. Don't use the same facilites over and over again. Don't use the same general routes. Don't allow the public to know in advance of any vip visit! Buy the very best technolgy for wireless communications and make sure everone knows how to use it. Do not let other agencies communicate in the clear or give their locations in the clear. Punish any lapse in security swiftly and compensate those who follow the plan with rewards.
Humbley submitted by an interested observer.

Jim I just picked up a pro2006 and am very happy but
something you said reminded me of how I pestered the
salesclerks to open each model and break out the
manuals so I could do some comparison between models
(the clerks just wanted me to handle the floor models
like that's gonna tell me much beyond it feels good
in my hands).

I've seen that there are TANDY people here monitoring
the conference...here's a free beni-sup for you to
get in good with your bosses.

WE, your customers, need a GOOD cross comparison
of technical specs (ala consumer reports maybe?)
between the various models in addition to access
to the floor models of your products.

When Clinton was in Detroit for the G-7 Job Conference, the route was in the Detroit News in full detail. No one at the News was dragged out and shot as far as I can tell. It's a big event, especially when he has to drive from an Air National Guard base to the city using 25 miles of freeway. The motorcade was flanked by a Detroit Police chopper with a SS agent inside who radioed any anomilies found along the route to the command center, which happened to be the Detroit Police Ch-5 in the clear. Also the state police frequencies here broadcast the location of the motorcade in the clear.
I agree the route isn't a secret and this isn't Russia yet. Although we seem to be headed there with the ESPCA.

I need to sell my PRO-46 and peripherals to pay a speeding ticket. Here are the details:

Radio Shack PRO-46 scanner purchased 12/19/93 no modifications done, never openend, UNDER WARANTEE UNTIL DECEMBER OF 1994. I have the packaging, manual, rubber duckie antenna, and sales slip (receipt). Everything is in perfect working condition.

Universal DC Automobile Power adapter. Plugs into cigarette lighter, has 6-foot cord with six detachable "ADAPAPLUGS". Voltage selection is 3, 4.5, 6, 7.5, and 9 volts. Tip Polarity selection with all tips. This obviously works with the scanner among lots of other electronic devices you may want in your car.

Car window BNC mount. This allows you to attach any BNC-tipped antenna (such as the rubber duckie) to the outside of your car with this window mount. Very convenient, portable, etc. The window can be closed entirely, there is no sticky substance involved so no residue is left on your window. Can be used as many times as desired. Includes 6 feet of 50-ohm RG58/U cable.

Radio Shack telescoping scanner antenna. This antenna can be attached directly to the scanner, or to the window mount for increased reception. I've had very much success with this antenna.

I want to sell everything together. Asking price is $200, make an offer if you don't like it. It goes to the highest bidder.

While I think I have most every scanner I need, I'm sure that if the mfr's came up with a new style, I may be tempted to add to the collection. After all, we can always use another scanner.....
What I'd like to have would be a scanner that does'nt look so much like a scanner or cop radio. A 100 channel scanner, that is built just like a 'Walkman' would be a good addition to my collection. People get so wierd sometimes when you have a scanner while walking or biking, or riding a bus. Walkmans are a
common sight, and I'd rather listen to Comm Center any day instead of 'Rokkum Hot 98fm', now put a tape deck along with it...Oh Joy!

2496. PSP frequencies - one more time

2498. HTs with extended RX

Newsgroup: rec.radio.scanner
Date: 1994-04-09 22:14:43 UTC
From: jerry@hnrc.tufts.edu
Message-ID: <1994Apr9.171443.2196@hnrc.tufts.edu>
Source record: 275656
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment

If any post needed a warning to proceed at your own risk,
this is is. That said . . .

It seems there are many of us in the market for a dual
band HT with extended RX so that one can be mobile with the
greatest amount of RX capability and the fewest number of
units. My summary of what's been offered is (no hands on
experience with any units) is . . .

The suggested models are
QST (March 1994) reported
typical sellling extended RX
price (from various
mod files)

ICOM W21AT 514 50-999
Standard C558 529 100-199,300-500,800-999
100-173,342-471,823-990 (PLL lock)
Yaesu FT-530 439 110-180,300-500,800-950
Alinco DJ-580T 409 ???

The DJ-580--or Alinco, rather--gets mixed reports. Some
really like their units. Others report of (or of hearing of)
bad experiences wtih the 580. It's the least expensive of the
lot. One ICOM/Alinco dealer told me the 580 has the less
tight front end and would not be as suitable in a high RF
location.

The Standard, already the most expensive to begin with,
requires an extra CTCSS unit. Extended RX is a keyboard
function.

The FT-530 is less expensive and has a slide out lithium
backup battery. Extended RX is a hardware mod.

The W21AT has the widest range of extended RX.

Some questions remain, however. There have been reports
that the wideband reception in these units limits their
abilities as scanner-replacements. (Unfortunately, since
these capabilities are undocumented, they are not even
mentioned in comparative tests such as QST's.) Is this really
the case? Are they much worse than a low end scanner?

I started out leaning toward the Standard (built like the
proverbial battleship) but was put off by /having to get CTCSS as

an addon.

I am now undecided between the Yaesu and the ICOM but am
leaning toward the ICOM because it *may* be able to serve as a
poor man's monophonic walkman (88-108Mhz reception).
Can an owner comment?

There is another question I'd appreciate an informed answer to.
There are a few extended RX channels I'd like to scan on occasion
and would devote a few memory locations to them. Presumably, the units
requiring the hardware mods would be able to remember the frequencies.
Would the ICOM forget them? I assume the extended RX must be reentered
each time the unit is turned on, or is the unit smart enough to
remember them, even though they're extended frequencies?

(All comments and corrections--even flames--gratefully appreciated.)

>If so, then why do we have to pay 95 cents a minute to
>get weather information that our tax dollars have already
>paid for?

I suggest you don't emmigrate to New Zealand, the land where
"user-pays" is government policy". You might find the shock
too much :-)

User-pays applies very much to weather forecasts and information,
and the forecast 0900 service has become generally accepted.
Safety and broad-coverage forecasts are still freely available,
but most specialist and detailed forecasts must be paid for.

The general public can of course listen to the radio or TV
and get forecasts that will satisfy most needs, but if you
want a forecast _now_ - you can't just make a call to the
local Weather Office and get a free forecast. You either
call an 0900 number, or call the Met Service and pay to
get individual attention. Or you can go to a private
forecast-supplier.

The change to "user-pays" forecasts was quite abrupt, but
it was reasonably quickly accepted simply because of the dramatic
changes happening everywhere. Most large publicly-owned services
were sold, or turned into corporations. The forecasting side
of the Met Service became a State Owned Enterprise - effectively
a commercial company, with the government as the shareholder.

NZ is a world-leader in "user-pays", and the selling-off of
publicly-owned services. Rest assured, governments in other
countries are taking a keen interest in the New Zealand
experiment - and that includes meteorological agencies. You
can expect to see less "free" access to weather in the US.
Never mind that you think you've already paid for it with your
taxes. That argument applies here too! If the taxes really
did pay for all the "free" services, all our budgets would
be nicely in the black :-)

> the case? Are they much worse than a low end scanner?

Depends on where your scanning. If your scanning in or near the HAM bands
the unit was designed to receive it'll do nicely. Also, a lot of these units
lack a sufficient number of memories to be used as a true scanner replacement.

> I am now undecided between the Yaesu and the ICOM but am
> leaning toward the ICOM because it *may* be able to serve as a
> poor man's monophonic walkman (88-108Mhz reception).
> Can an owner comment?

I've never seen an HT that will receive an FM signal in wide-band FM mode,
which is what you would need if you plan on listening to anything in this
range. My W2A will receive *strong* signals in this range, but is utterly
useless because it's receiving it as a narrow-band FM signal.

> There is another question I'd appreciate an informed answer to.
> There are a few extended RX channels I'd like to scan on occasion
> and would devote a few memory locations to them. Presumably, the units
> requiring the hardware mods would be able to remember the frequencies.

Hardware mods or software mods, every HT I've ever seen will remember them.

> Would the ICOM forget them? I assume the extended RX must be reentered
> each time the unit is turned on, or is the unit smart enough to
> remember them, even though they're extended frequencies?

From my experience with Icom units, the "extended recieve mods" configures the CPU in a fairly permanant way (you *DON'T* have to perform the sequences every time you turn it on. Most HTs I've seen will remember whatever frequency you enter into the memory.

Quite frankly, if you're a serious scanner enthusiast you'll be sorely disappointed with using an HT as a scanner unless your content with scanning only a few frequencies at a time and aren't going to be scanning too far out of band (20-30 MHz). As always, your RX milage will vary from HT to HT.

From: Jerry.Smith@f747.n115.z1.fidonet.org
Message-ID: <9404102317.AA735@nwugate.fidonet.org>
Source record: 275668

Hi, Ken...
K> My questions follow:

K> 1) Is there any chance to modify the Pro-51 to receive cellular?

No. From what I understand, this is the first unit to comply with the Telecommunications law passed last year making it illegal to monitor cellular phone calls. (you can use the image method to receive _some_ calls by searching between 890 and 910.

K> 2) Can anyone more knowledgeable than me recommend a good (moderately
K> priced) base-type scanner that can capture the full 800 mhz range
K> including cellular? What would be a good price to pay? Where is the
K> best place to shop?

If you can afford it, I recommend picking up the PRO-2006 scanner from Radio Shack. It's $400 ($359 from Grove). The mod takes 3 minutes to do from opening to closing the case. The unit is the best and has a great following for units in this price range.

K> 3) I've heard about "Monitoring Times" and have checked four good sized
K> bookstores but can't locate this publication. Is it the best one to get,
K> and if so, how does one subscribe?

MT is pretty much a subscriber based publication. It is an excellent magazine and encourage you to subscribe.

Monitoring Times
P.O. Box 98
Brasstown, NC 28902
One year...$19.95
Two Year...$38.00
Three Year...$56.00
(U.S. rates)

Grove Enterprises sells the '2006 for $359 + S&H. Their number is 1-800-438-8155. In a couple of weeks, this unit may no longer be available as the law kicks in on the '26 of April.

Jerry

Note...I am not a rep of Grove in any way...just a satisfied customer.

l> start drying up. I'd really like to get a PRO-2006, but can't quite
l> justify the $$$... I have a BC855XLT which is OK -- other than the

Larry...I suggest getting the '2006. It does have a better circuitry.
See, the unit has a triple conversion design which helps to eliminate the
problems that you describe with the 855 XLT. The '43 has the same triple
conversion design. Both units are made by GRE. After these two models,
the rest pretty much perform the same way with the same double conversion
design and problems with images and signals showing up where they shouldn't
be. (BTW, the '43 isn't perfect by any means with images. Problems have
been reported in the 161 range as well as the 470 range.)
If you are hesitant about the '2006, I suggest you try one out from RS or
Grove Enterprises. Both have a 30 day return policy. (Grove is $359 as
opposed to $400 from RS)

Source record: 275670

In a message on 04/10/94, JIM KEARMAN (KR1S said to ALL about New Pro 43 failed ye*****:

References: <1994Apr7.184656.2364@arrl.org>

J(> : > Of all the things a new Pro 43 failed while driving down
J(> the road

J(> On the other hand, there are thousands of undamaged PRO-43s out
J(> there. I think Radio Shack has an excellent track record with their
J(> scanners, reliability wise. Stuff breaks. That's what guarantees are
J(> for. I don't think it's fair to single out Radio Shack. When you
J(> sell as many scanners as they do, you're bound to have a few
J(> problems. At least you can take it back to ANY store for
J(> refund/replacement/repair.

I related this experience that other a little while back but I thought that it is worth repeating.

Last December, my father-in-laws PRO-43 failed after HE blew the speaker out. It was about 5 months old. I had originally bought it from Grove but decided to take it directly to RS for service. The manager at the local store asked me if I wanted to send it out for repair or would I rather just take a new one? Without even blinking an eye, I took the new one.

So....while we've all had our problems with RS, me included, they have always resolved my matters to 100% satisfaction.

Message-ID: <Co1s7E.MH3@ecf.toronto.edu>
Source record: 275596

This is for a friend of mine.

For sale Realistic PRO-2022 scanner with the following features:

Frequency coverage - 30 - 54 MHz
108 - 136 MHz
136.005 - 174 MHz
380 - 512 MHz
806 - 960 MHz

Radio has been recently modified for cellular reception.

2 second scan delay
Selectable priority
Battery backup
Search function
10 monitor channels independent of the 200 scanner channels
Individual channel lockout

Radio is in an excellent condition, hardly ever used. My buddy bought it
about 3 years ago and used it for a total of maybe 2 hours.

Best offer takes it. I'll consider any offers.

Both KVO and TKO refer to the same (slow) flow rate; KVO is Keep
Vein Open, and TKO to To Keep Open. The intent is indeed to
maintain a route for quick medication or additional fluid access.
As several people posted about a week ago, lactated Ringer's is
sterile water with a specific combination of electrolytes and
lactate. It it _not_ water with glucose and salt added; that
would probably be D5NS -- 5% dextrose in normal saline.

bae> I'm not sure he got them all. The barracks assignments (who uses which
bae> frequency) will be out Tuesday via emai only originally and then posted
bae> eventually.

The list I posted includes ALL PSP Patrol. It DOES NOT include any for PSP Turnpike, the radio system is run by the PTC, DA Office/Drug Task force as these systems are also operated by different agencies.

Any blanks in the list posted are TROOP OPTIONS. Many troops program local VHF agencies into the radios. An example is PSP Troop B has Peters PD in their radios and regularly switches over to communicate with the departments on our system.

As for which troop uses which. I have been working on this, but the list is very incomplete and only covers western PA. Most of the pubilished lists are VERY IMCOMPLETE & INACCURATE especially the ones in the national magazines.

The 158.760/156.015 pair is also ch 32 in some radios, especially in the western part of the state. The attempted phone patches are always a waste of time, and they definately need to improve the system, at least on this side of the state.

The 2 PTC repeaters ONLY use a tone on the TX side. The tone is NOT present on the output of the repeaters. The tone was added to combat an interference problem on the eastern part of the state from fisherman using portables programmed with wrong frequencies.

Craig,
The only two things I can think of right off the top of my head are
1) Newer cordless phones
2) Alphanumeric pagers. Some of them are in the 900 MHz spectrum. I have also
heard of RFI problems from the VHF (152 MHz) models.
Hope this helps!

At that price, assuming you are buying new it would have to be
the Radio Shack PRO-43. Hands down, no question, take it to the bank.

Larry Spence (larry@cs.com) wrote:
: I'm trying to decide on another scanner to buy before the good ones %)
: start drying up. I'd really like to get a PRO-2006, but can't quite
: justify the $$$... I have a BC855XLT which is OK -- other than the
: well-known problem of it generating images of the local UHF TV stations,
: etc., smack in the middle of the "interesting" bands (you know, the
: ones we don't listen to %). So... I see a lot of references to how the
: RS scanners have much better selectivity and image rejection than the
: Uniden scanners. Is this only true for the top-of-the-line RS models
: (2006, 43), or in general? To be more specific, is the PRO-46 a better
: performer than, say, a BC200XLT or a BC855XLT? Do I have to get a 43 or
: a 2006 to get much better reception than my lowly 855? And are all the
: RS scanners made by GRE, or are some merely repackaged Unidens?

: The 46 looks to be around $190 by mail order, whereas the 200XLT runs
: about $210 (the 855 cost $160). I'd pay the $20 extra just for 200
: channels vs. 100 channels, but if the RF section of the 200XLT is no
: better than the 855, well... %(Are there any other candidates I should
: consider in the $200-250 price range?

I believe the Pro-46 is a Uniden design. I'd really recomend you stick with either the Pro-43 or Pro 2004/5/6 (A used one should be within your budget). Uniden scanners seem to have a lot of bells and whistels but aren't very good receivers. Not all RS scanners are GRE made so watch out (I think the Pro-37 and 39 are though). The 43 and 2004/5/6 are triple conversion which means very little chance of intermod being a problem.

It seems there are many of us in the market for a dual
band HT with extended RX so that one can be mobile with the
greatest amount of RX capability and the fewest number of
units. My summary of what's been offered is (no hands on
experience with any units) is . . .
<stuff deleted>

Don't do it Jerry.

I haven't seen a whole lot of HT's used in scanner service, but those
that I have seen have been sorely lacking. The extended receive ability
is just that... an extended receive. It is not a true "scanner" mode.
It is slow, it lacks banking and priority channer organization and it
makes the radio sensitive to overload and intermod, diminishing its value
as a communications tool.

Here's my two cents worth. Get a good scanner and a mobile transciever.
The scanner will get you the entertainment you desire and the transciever
will work the repeaters and simplex stations. If necessary, substitute
an HT for the mobile transciever. It will not do much for simplex but
will work those repeaters that are within a close distance.

If you choose the scanner/HT solution, consider the Radio Shack HTX-202.
It's a ham-band only radio with a very good front end and great audio
(for an HT). It's on sale until the end of the month for less than $190.
It's a great radio but don't take my word for it. Ask someone who owns one.

I abused my swell new icom w2a by using it as a mobile radio for a year.
I couldn't afford an HT and a mobile radio at the time. I now have both.
I can't imagine being without the mobile radio but life is possible
without the HT.

A freind is considering the purchase of an Icom R9000. I am suggesting
that he would be better off to get an NRD535 and one of the new R7100
vhf/uhf receivers from Icom when they come out plus two PC's and a good
spectrum analyzer instead. I believe that all of the above can be purchased
for less than the cost of the R9000 provided the spectrum analyzer is
purchased used.

I have been told that the HF performance of the R9000 is only marginally
better than the R71A from Icom and that the panadaptor is somewhat brain
dead and that the power supply in the r9000 runs hot. I also seem to remember
a thread about the r9000 a year or so ago in this newsgroup where some
of these things were discussed.

Can any r9000 owners shed some light on this discussion? How about the
capability of the computer interface? What about the receiver performance
and the the performance of the panadaptor? Any help would be appreciated.

Yes the R-9000 power supply heatsink is a bit warm to the touch.
That might be a problem for germanium transistors, but I don't
think the R-9000 has any.

The spectrum scope has ranges of +- 25, 50 and 100 kHz, plus
store. This is fine for DC bands, but VHF and UHF need much
more dispersion.

Audio quality is good for a communications receiver. Best sound
on SW since my SX-62a. Line out audio is weak and hum is a
problem. The 9000 really needs a Sony 2010 style SYNC detector
for the best SWBC listening.

I have not noticed any overload or intermod problems. The QTH
is not intermod alley by a long shot, but there is enough RF
about to mess up every active antenna I've tried.

I have not had the time to get serious about the computer
interface. The computer can read the radio's S meter but not
the 900 memory locations.

The radio has two tuning knobs. One tunes the VFO, the other selects
memory locations. Very convenient for checking 30 BBC frequencies to
find the best reception, or the 6 stations that may carry Larry King
or Rush Lumbaugh.

FM has 30 KHz bandwith, which should be 50, and only works above
30 MHz. The digital AFC is nice.

The TV demod is superfulous. More filters and analyzer dispersion
would have been more appropriate.

I've owned an R9000 for about 18 months, and thought I'd add my comments to Chuck Forsberg's.

I think Chuck was a little mild in his praise. Bells and whistles aside, the R9000 is simply the best HF receiver I've ever heard. I don't any experience with NRD so can't make any comparison. It beats the heck out of the receiver in my IC-751 transceiver, which is about the same vintage and technology as an R71, and I thought the IC-751's receiver was pretty good.

I first played with the R9000 at a friend's house, with a decent antenna. The lack of internal noise and the audio quality just blew me away. Sideband signals on the ham bands suddenly became pleasant to listen to.

I agree with Chuck that the spectrum display is too narrow for VHF/UHF. The TV be somebody's cup of tea. A 50 KHz FM bandwidth would have been nice, but polar WEFAX pictures look fine anyway.

I did my usual poking around with the computer interface and found a bunch of undocumented commands, as is usual on any ICOM CI-V radio. The command set is the most extensive of any ICOM radio, but still has funny quirks. Chuck is wrong on one issue -- you certainly CAN read any of the 1000 memories. The only thing you can't read out of a memory is the tuning step. You can set AF and RF gains (don't play with the AF gain command with headphones on :-)), and read the S-meter.

The heatsink gets warm, but not really hot. The inside of the radio doesn't get very warm at all.

As most people are bothered with pager interference in their radios,
I would like to monitor pager broadcasts.

What equipment is required (besides a computer and a scanner)?

What are the specs of broadcasts (baud rate, data type, etc)?

Thanks much!

Scott

Re: PRO-43 Memory Mod Update

ATTENTION PRO-43 MEMORY HACKERS!

The following explanation from Tom Lambert, in connection with our recent
series of articles in the WORLD SCANNER REPORT will guide you to a
successful memory expansion of the PRO-43 from 200-ch to 400-ch.

You should have in your possession, the following issues of the WORLD
SCANNER REPORT: V3N10 V4N1 V4N2

==========
From : Tom Lambert 1:202/731 Fri 08 Apr 94 21:50
Subj : Mem. mod Pro-43
****

..Hello Bill, I received the disks you sent me. Thank you very much for the
information. I have a few more tidbits on the EEproms used in the Pro-43.
The EEprom (AK93C67F) is manufactured by Asahi Kasei, apparently in Japan.
As of right now there are no reps or distributors other than Tandy. At
least none that I have been able to find. I have leads on an up coming

EEprom due out by Microchip Technologies (same mfgr as the Digi-key parts) that is suppose to be a direct pin for pin replacement for the AK part used in the 43, and again the cost is around $2 to $3. The only problem is they will not be available until the third quarter of this year. I am slated to get acouple of samples and data sheet from our local Microchip rep as soon as the chips are available. The chip should be available to the public through Digi-key and other distributors for Microchip Tech..

I also received the copy of the BBS posting from Gary Mumma. I would like to respond with the following; . PLEASE EVERYONE DO NOT PANIC.. THE MEM MOD TO THE PRO-43 IS ALIVE AND CAN BE DONE !! Even with the Digi-key part specified in previous issues of the.WSR!!!

If you use the original part AK93C67F, Tandy part # MX-8050, price (at least on 11/11/93 when I purchased them) is $22.32 each. These are pin for pin replacements. I used them for my first mem mod. The Digi-key part I used is part #93C66/SN-ND. The price was $2.11 each when I purchased them. These are not pin for pin compatible, as I warned before by saying to make sure you get the data sheet before you install the parts or before you order the parts. BUT THEY CAN BE USED as will be explained below. I used them in one of my mem mods with one very little problem, and that was making sure I correctly wired the pins, due to having to cross pin wire the ICs. If you do not mind the cost and do not want to worry about crosspin wiring then by all means use the Tandy part. They are the original part used in the scanner. The cost for two pieces required for the mod will be around $44.64 plus postage and handling. Your other choice is to wait for us to find a less expensive part. As Bill said, "the search continues".

What ever your choice, please read the following. I do have to apologize for my assumption that everyone knows what I may know and do automatically. Not every one knows who to contact to get the information to judge if a part is useable or not and may need more information. Therefore, Bill, you being an engineer, already know about part compatibility, but for those who do not know or may not be clear on the subject, please let me explain pin for pin compatibility versus a usable part that is not. If one is going to replace a part on a PC board then one has to make sure the replacement part is indeed a direct pin for pin replacement. Or pin for pin compatibility. That is to say if pin #1 ofthe original IC is designated CS (chip select)

Continued from the previous message...
**
then pin #1 of the replacement IC also has to have the same designation, CS. If pin #2 is designated clock then pin #2 on the replacement has to be designated as Clock etc.

However a pin may have what seems to be different designations but in reality they may be the same. One such example is the clock pin. One mfgr may call it simply "clock". Another mfgr may call it "serial clock" (SK). And still another may call it "data clock" (DC). Different mfgrs names but they are all the same. This is where a data sheet is very important when we try to sub a part for the original one. If a person is doing what we are, that is putting the new part on a PC board in a different location and connecting the new part to the original part by way of individual wires one pin to another then the parts do not have to be pin for pin compatible. That is to say, pin #1 of one part does not necessarily have to go to pin #1 of the other part. In our case, using the Digi-key part (93C66) as the newly added IC, pin #1, (CS) (the chip select) of the (93C66) IC would go to pin#3, (CS) of the original IC on the board. The pins even though not the same number are still the CS (chip select pins). Therefore, just because the new part is not pin for pin, it does not mean the part is not useable.

The main concern is that the new part can be connected to and has the same pin designations as the original part, even though they may not be the same number. In our case, the original IC has a NC (no internal connection) pin, a VCC (B+) pin, a CS (chip select) pin, a SK (serial clock pin, a DI (data in) pin, a DO (data out) pin, a GND (ground) pin and a PE (program enable) pin. The PE pin is held high by tying it to the +5v, keeping it on at all times. By connecting it this way, it is as if the pin is not used as the CPU does not use it. Pin 1 has no internal connection, therefore it is not used. So if we are not using a pin for pin replacement then we do not have to be concerned with them. This means the only pins we need on the replacement IC is a Vcc, CS, SK, DI, DO and a GND pin. Or a pin which is the same as the one needed even though may have a slightly different name.

The Digi-key (Microchip Tech.) part 93C66/SN-ND gives us an added but not incurable problem. It has two new pin designations. Pin #6 ORG (organization pin) and pin #7 TST (test pin). A quick call to a Microchip Rep in my area, revealed that the ORG sets the EEprom to either an 8 or 16 bit structure. The original IC in the scanner uses a 16 bit structure. The tech or data sheet stated that if the ORG pin is left floating (not connected to anything) the chip is automatically configured to the 16 bit structure. So we do not connect it to anything. The TST pin is to test the IC. It requires a + signal to activate the internal test sequence. Our

scanner does not do any testing of the IC so we tie the ORG pin to ground, either by jumpering it to pin 5 (VCC or ground), which will be connected to pin 7 of the original IC in the scanner, or connecting it to a ground point in the scanner. That is all to the two other pins not on the original IC. The following is the cross pin wiring or connections to be made if using the Digi-key part mentioned above.

```
Digi-key (93C66) To Orig. mem. IC in Pro-43
================ ==== ======================
Pin #1 (CS) -- pin #3 (CS)
Pin #2 (clock) -- Pin #4 (SK)
Pin #3 (DI) -- Pin #5 (DI)
Pin #4 (DO) -- Pin #6 (DO)
Pin #5 (VSS) -- Pin #7 (GND)
Pin #6 (ORG) -- Pin #7 (GND)
Pin #7 (TST) -- (No Connection)
Pin #8 (VCC) -- Pin #2 (VCC)
```

Again if you are not technically inclined, do not have data information available, do not want to worry about cross pin wiring, the possibilities of wiring errors easily done when cross pin wiring or the possible confusion of the difference between pin designations used by different manufacturers, then by all means, use the original (but costly) parts available from Tandy, or wait for Bill, I or someone else to find a less expensive part later. I hope your scanning hours are full of intrigue and fun. Happy scanning. Tom.

Well, for BBC it would probably work OK, but if you are trying to receive INMARSAT, it would't work too well.

Most all antennas are inexpensive to build. It's usually the math that is the biggest barrier. Antennas are one of the last radio accessories that can still be home-built as good as the "factory" ones.

There are lots of designs out there. It usually depends on the frequency you want to monitor, and whether you want omni or directional coverage.

For general scanner use a Discone is a good antenna, but a little harder to build. A 1/4 wave ground plane antenna can be built from some copper wire and a PL259 connector.

Practically speaking, many local scanner signals are so strong that ANY antenna will do ok. If you want the weak signals, then you need to get an antenna with some gain, like a yagi, colinear, or log-periodic. Check out a ARRL Amateur Radio Handbook for antenna building ideas.

: little chance of intermod being a problem.

I wouldn't go *that* far. I use my '43 in the car and have plenty of problems. They only happen at specific places (probably near transmitters) and can be avoided. My BC70XLT, however, was totally unusable around Washington, D.C. I love the 43 and think that it's a great radio, but it isn't perfect. You could probably fix the 43's minor problems but would you want to spend $600 on it?

Good listening, everyone.

Anything for a local :-)
There are basically 5 handhelds that come to mind that would be better than the R1.
1. Yupiteru MVT-7100
2. Camnis ??-050
3. Trident ??
4. AOR AR1000
5. AOR AR1500

The first three are not really available in the US, but can be ordered. The 2 AOR models get mixed reviews. The MVT-7100 is the clear king of full coverage HH scanners.

If you want a base/mobile, look at the AOR AR3000A.

I have yet to see a commercially available product that can decode MDT data.
The major hurdle is the proprietary code scheme used by each manufacturer.
There are a few companies working on this (or so I've heard), but I have not
seen anything shipping yet.

>broadcasting. Is this all true/accurate? What will this mean for the
>scanner world? Just thought I wold raise a topic.
> Chris Fowler

Digitally encoded data over Narrow Band FM systems is already widely used
in some areas. Typical examples are microwave data links, the
digital control channel on 800 MHz trunked systems. The digital
control channel for ANALOG cellular phones. The control channels
AND the data channels for TDMA digital cellular.

And all that is as applied to conventional NARROW BAND frequency
modulation methods.

Direct sequence spread spectrum is a form of DIGITAL MODULATION
in wich a very high speed digital bit stream is used to "spread"
the signal out over a range many MHz wide. When successfully done,
the signal actually disappears into the noise floor! (At least as
far as a conventional NFM receiver, scanner or or spectrum analyzer is
concerned.)

Multiple SS systems can all occupy the same bandwidth and "center
frequency" provided the they all have a unique "pseudo random"
spreading code.

Regardless of how digital data is sent, it can still be encrypted
to the point where supercomputer resources are needed to decode
the data in a timely fashion. The entire premise of cryptography
is based on the fact that you EXPECT people to intercept the signal!
While the transmitter and receiver who know the key can encrypt/decrypt
on-the-fly in real time, those who do not have the key must do an
incredible amount of off-line numbercrunching to decode a message.

In 15 years (maybe 10) scanning will be dead and buried. Better
study up on digital modulation techniques and pick up a good book
on cryptography if you want to hear anything! ;-))

While there may be emerging RF digital standards as far a network IDs,
packet headers and the like, the DATA of interest will probably be
kept private via encryption techniques.

One trunked system in our area will be going fully digital in a few years. TDMA cellular will probably be in our area in 2 or 3 years. Some of the larger metropolitan areas have it already.

Happy scanning! Enjoy it while it lasts! ;-))

My PRO43 is GREAT at every band except one. 155-160 MHz. For some reason every timme I listen to trains in the Bay Area, I get nasty interference from the local NOAA weather station. It is almost always up 1.2 MHz from what I want to lister to.

It isa real nasty combination of tones and reduced voice. When I went to Roseville, I got great train reception with no interference. But, when I came home, it all started over again.

Any ideas about why, or how I could stop it?

Many thanks,

Hi, David...
Not sure which model you have. Anyway, the first thing to check is to
see if there are any suspcious looking solder joints. Check especially
around the volume/power control switch. Also check the battery terminals
for corrosion. That's about all I can think of for right now.

h> i figure that someday I may want it all, so the more range and features,
h> the better.
Hi, Robert...
I have the 2500. Operation is spotty at best. Unless you live in a
very rural area, this unit may not be what you want. If you go through CE,
be sure they have a return policy in case you don't like it.

With my 2500, it is a love/hate relationship. For example, I am able
to get one of the local police depts here on three different frequencies.
Not a good thing. Intermod is more apparent than on other models of
scanners.

Auto search and store is pretty neat as well as the hit counter. 100
channel per second scan is excellent, especially when searching out in the
cellular band.

Has 10 priority channels, each channel in the first 10 banks.

For me, it is hard to say yea or nay. That;s why I suggest the return
policy verification.

Good luck, Jerry

The reason you can only hear one side of a cellular call is because the
carriers are on to us scanner owners. The mobile side of the call is not
'repeated' through the cellular tower. The landline side you will always
hear.

From: berling@reis60.alleg.edu
Message-ID: <2ocr3e$hgb@mustang.alleg.edu>
Source record: 275525

It seems my clarification didn't make it to Usenet. I certainly
didn't mean any malice or mayhem towards Mr. Christian. His list was good
and did leave out the options. I posted the list as is because it was
given to me by the Chief of Electronics of PSP, based in Harrisburg (who
happens to be a neighbor). Far be it from me to assume that he was
feeding me information that may not apply to everyone. I didn't intend to
step on any toes - just trying to offer information that others on the Net
might find useful or enjoyable.

Is there a difference between the Commtronics and the HB-232
interface (I believe that's the name) ? Are they the same thing?

Current Canadian law states you may listen to ANY point to point transmissions you wish while mobile or fixed, as long as you do not divulge the contents of the transmissions monitored. Yes, it is that simple and (sigh), taking their cue from the American cellular industry, the Canadian cellhead complex is mounting an assault upon the status quo. Nothing lost yet. So come on up to the True North Strong and Free and breathe some fresh air.

Sorry..no West coast freqs tho. But enjoy your trip.

: In 15 years (maybe 10) scanning will be dead and buried. Better
: study up on digital modulation techniques and pick up a good book
: on cryptography if you want to hear anything! ;-))

Any one listening to federal agencies can already tell you that digital voice is already here. All of the "secret" stuff is now heard as white noise. All new trunking systems will be digital voice, some are operating today.

: One trunked system in our area will be going fully digital in a few
: years. TDMA cellular will probably be in our area in 2 or 3 years.
: Some of the larger metropolitan areas have it already.

TDMA Cellular is here today in the Bay Area. Only the common folk talk on analog phones, we have read in the newspapers that all of the movers and shakers have moved to the privacy of TDMA white noise.

: Happy scanning! Enjoy it while it lasts! ;-))

This new technology is really adding more simaltanious users per frequency as an added benifit there is a perception of privacy.

The requests for cello mods will give way to dsp drivers for particular modulation types. Scanning as we know it will be gone sooner than you think, only to continue on into the digital age.

Green Card Lottery 1994 May Be The Last One!
THE DEADLINE HAS BEEN ANNOUNCED.

The Green Card Lottery is a completely legal program giving away a certain annual allotment of Green Cards to persons born in certain countries. The lottery program was scheduled to continue on a permanent basis. However, recently, Senator Alan J Simpson introduced a bill into the U. S. Congress which could end any future lotteries. THE 1994 LOTTERY IS SCHEDULED TO TAKE PLACE SOON, BUT IT MAY BE THE VERY LAST ONE.

PERSONS BORN IN MOST COUNTRIES QUALIFY, MANY FOR FIRST TIME.

The only countries NOT qualifying are: Mexico; India; P.R. China; Taiwan, Philippines, North Korea, Canada, United Kingdom (except Northern Ireland), Jamaica, Domican Republic, El Salvador and Vietnam.

Lottery registration will take place soon. 55,000 Green Cards will be given to those who register correctly. NO JOB IS REQUIRED.

THERE IS A STRICT JUNE DEADLINE. THE TIME TO START IS NOW!!

For FREE information via Email, send request to cslaw@indirect.com

: I wouldn't go *that* far. I use my '43 in the car and have plenty of
: problems. They only happen at specific places (probably near transmitters)

Did you have it hooked to an antenna outside the car? Cars are pretty noisy radiowise so it might have been a problem with the front end desensitizing. I've heard from a number of people that have had problems caused by this. In any case the 43 is still a great scanner for the money.

2578. how do you monitor police 800mhz systems??

I have an old Cobra CB radio in my car that I use very infrequently.

I have noticed recently that when I turn on the CB radio on channel 19, it stops my BC100xlt scanner (with an external antenna) on a state police frequency, 155.910 I believe.

What causes this? Is there anything I can do to eliminate the problem, short of not having both on at the same time?

If I remember correctly, the user enters the state into the BCT2 and it has the highway patrol frequencies pre-programmed. For example in California the 42MHz band is used. The other method that can be used (not sure if the BCT2 does this), is to monitor the mobile repeater frequency that is located in the police cruiser. Mobile repeaters act as repeaters for the police handheld units, so the HT transmits to the car, and the car retransmits to the base. In California the frequency is 154.905MHz. It is a good frequency to monitor while mobile, since they have a limited range (about a mile or less), and activity on this frequency means a car is near by. The are many downside to relying on this. If there is not radio traffic, then you won't know if a car is near, and many of the newer CHP cars disable the repeater if the transmission is in "drive".

I agree. Wideband is synonimous with intermod. How about a scanner that has "plug-in" RF modules for different bands? The digital control stuff could be built in and the user could pop in the band module - complete with filters.

g> So far all my frequencies to try have come from the Police Call.
g> Can anyone suggest additional frequencies, or another source for finding
g> suitable frequencies?

Hi there. I'm from Naperville, right on the race track for the BN.

If you're interested in monitoring the Burlington Nothern try the
following.

161.100 F1 ROAD: simplex local, linked via a microwave system to the
Galesburg dispatcher.

160.425 F5 PBX repeater with PBX autopatch i.e telephone interconnect.

160.650 F2 Milsc use. Mostly yards, and MOW
160.550 F3 same

System details.

161.100 is the primary communications channel for the entire
BN. It is used in a simplex mode for local transmissions by
portables and mobiles in cars. The radio in the engines are 120
channel Motorola Spectra 9000 radios. They have the ability to

select any of the 99 standard railroad channels. These radios
can also select different tx and rx freqs to access different repeaters
This is how engines can run through to anywhere in the country.
A unique feature of the BN system is the microwave link to the
Galesburg
dispatcher. The section of mainline from Chicago to Aurora is call
the "East End" with the section from Aurora to Galesburg the mainline.
Both are in the Galesburg division. Now, back to the radio system

The Microwave link is activated by MDC-1200. (Motorola Digital Code
1200 baud). This is a squawking tone heard at the end of the
transmission
It includes a locomotive ID number and a code to active the Microwave
transverter on this channel.

The types of communcation heard usually are train requesting permission
to unlock switches, proceed past oposin aspect signals, passing other
trains in a siding etc etc. These transmission normally take place on
F1 Road with the microwave link. Yard operations and conducted on the
simplex local channels. F5 PBX is used mainly for its high coverage
repeater by the Special Agents (RR Law enforcement) or telephone
interconnect to the BN phone system by all others, mostly supervisors.

i hope all this helps. I've been a train buff and model radilroader
long
before I became a Amateur radio operator, or scannner listener.

btw, that spur line is part of the BN. It really doesn't receive much
use.

One interesting spot in Turner Junction in Batavia. This is where the
BN
spur line, EJ&E and C&NW meet in a rather complex crossing still
control
by on the last manned switch towers in the Chicago area.

... ... So just when _did_ you run out of ammunition?

You program in all the frequencies, lock out the control channel(s), use no delay, and keep your finger on the "scan" button. A busy trunked system with more than 5 frequencies, is very difficult to monitor. You just have to be able to identify the voices so you know which conversation to stop on. Not much fun!

148.240 and 148.455 MHz in Canada?

Is 152.515 a particular agency or service, or simply
general "public service"?

Any special allocations on 298.525 MHz, that might use FM?
I know that's typically a military aviation AM frequency.

Voice "numbers" transmissions have been heard on these
frequencies in the Winnipeg area.

Thanks.

Jim

2595. IDEA - Single Band Scanners

Newsgroup: rec.radio.scanner
Date: 1994-04-12 18:38:30 UTC
From: Eric White <ewhite@chop.isca.uiowa.edu>
Message-ID: <766176002-0-7404@chop.isca.uiowa.edu>
Source record: 275566

Is it time to bring back the single band scanner? The current philosophy seems to be a "one size fits all" radio capable of receiving DC to Daylight frequencies. But that also means compromises.

Many scanner users are only interested in one or two specific bands. For example, I listen almost exclusively to railroad frequencies. There isn't a single handheld on the market today that does a real good job on the RR freqs (159-162 Mhz). Well, maybe the Yupi MVT-7100, but that's a bit expensive for someone who's just listening to choo-choos.

I'd much rather have a tight front end, high sensitivity, and good intermod and image rejection in a 159-163 Mhz only rig. (Toss in the NOAA freqs since they're so close, and maybe expand it for Marine band users down to 156 Mhz). Yes, I'd like to keep all the handy features and fast scan speed of the latest GRE or Uniden radios as well. I'll continue to use my "one size fits all" scanner for the few things I need to listen to outside that band.

Eric

Alex

2599. Cheap Scanner & Cellular Mod

Newsgroup: rec.radio.scanner
Date: 1994-04-12 22:26:15 UTC
From: shawnlg@netcom.com
Message-ID: <shawnlgCo63ns.LC9@netcom.com>
Source record: 275553

I sold my scanner about 5 years ago, because there wasn't anything interesting to scan in my small town. Cellular phone calls sound interesting, so I'd like to get another cheap scanner that can be modified to scan cellular calls, or get a device that'll move the frequencies of the cell band into another band. I'm new to the news group, so I haven't seen much background on this.

I heard of a device that can be screwed on the antenna of a handheld scanner. This sounds handy. Any ideas?

Add the Icom IC-24AT to your list. 2m/70cm transceive, plus receive coverage (roughly) from 73.250 MHz to 954.775 MHz. Those are the limits at which the VCO starts to unlock. There is a gap in the 130 MHz area. The civilian aircraft band is automatically received in AM mode. I'm not sure about the military air band. Reception at the edges of the tuning range is poor. Also, the display will indicate any frequency from 0.00 MHz to 1 GHz, but the RF circuitry won't go that far.

The '24AT can have extended frequencies programmed into its memories and they will stay there, so it can be used as a 40-channel scanner.

Yes. But you also need a scanner which covers the frequencies used by both
VHF and UHF television stations, and the ability to MANUALLY CHOOSE WFM
when tuning those frequencies.

Many scanners do not cover the UHF TV frequencies and may be engineered so
that many of the birdies end up in that range. Manufacturers didn't see
coverage in that area as important ... e.g. the doomed BX2500XLT.

From: sternk@alumni.cs.Colorado.EDU
Message-ID: <2ofdpa$nac@lace.Colorado.EDU>
Source record: 275558

While listening to the input frequencies of Denver's PD/FD, I
will sometimes hear someone talk about going to channel x-and-such. Since
this is a trunk system, I was wondering how this is possible.
Is there a way to tell the trunking computer to create a virtual
channel? Do trunk hand-held radios know how to switch to a simplex
frequency?
Being that I am at work, I have not been able to turn up my
scanner to determine if I can recognize the person's voice who announced
they were going to channel x-and-such after the announcement.
Anyone have any information on this?

>
>- Dave

You didn't say whether you were transmitting or just receiving on the CB, but what is happening is a harmonic of one of the oscillators happens to be 155.910. You can't stop the harmonic from being generated (without modifying the rig), but you can keep it bottled up inside the CB. There are two main paths for stray frequencies to get in or out: The antenna and the power cord. What you need is a low-pass filter in the antenna coax, and a low-pass filter for the DC power cord. Both of these items are widely available at any ham radio supply store. Just be sure you get a coax filter which has a cut-off frequency higher than the CB frequencies. Lots of them are made with a 30 MHz cutoff, which is just right. As for the DC cord filter, just tell them what kind of rig and that it's for the DC cord, and they will know what to recommend.

There is a third possibility which must be pretty rare, but I'll mention it just to have all bases covered. The microphone cord could possibly be picking up the harmonic inside the radio and then acting as an antenna. I've never actually seen or heard of this happening, but the easy way to find out if that's the source is to unplug it momentarily and see if the interference disappears. Probably, it won't, but if it does, you will need to open up the radio and install some small capacitors from each wire to ground. About 100 pf or so should do. Install them inside the radio - don't try to add them outside or on the mike itself.

This should take care of the problem unless the CB is generating a really strong harmonic - there's only one way to find out.

Good luck!

Bill, W7LZP

Cellular reception here in Europe is rapidly becoming impossible
by the growth of the GSM cellular net. It is fully digital and
encrypted and prices are almost the same (at least here in Denmark) as
the on the old analogue nets.

GRE makes the Super Converter II, that goes between the scanner and antenna. The downside of these is that the channel spacing will not be 30KHz as needed. When using these you tune the 400 - 512 MHz range on your scanner, and the device converts this to 800-912Mhz. Most cheap scanners default to 12.5KHz steps in the 400-512 MHz range. The other downside of these is that strong 400 - 512MHz signals will leak through, so sometimes you are not sure what you are listening to. I had the original Super Converter (back when they cost $49!!) and it worked fine for monitoring trunked systems.

> Anyone have any information on this?

I know that Motorola trunked systems have a privacy mode where two users can grab a repeater for themselves, that no one elso can monitor. The conversation will sound just like any other to the scanner listener. Another possibility is that the system has a channel designated for chatting that they can switch to, but others could also switch to this channel, so its not private. Also, some of the high-end radios have the feature to actually use simplex. This is a feature so that in the event of the repeaters or controller going down, they can still use their radios. I would be surprised if this was what was happening in your case though.

While I'm on a roll here, let me add that another feature used by police is a "capture" feature. They can press a button and hold a repeater so it will always be available. In a busy system, it could be very dangerous if the cop was in danger and got a busy signal when he tried to key his radio. This feature holds a repeater for his channel only so it will be available in an emergency.

>

PRO-2006:
You can program 10 search ranges on the 2006 instead of the 1 on the 43.
There is an audio out allowing you to tape without cutting off the speaker.
You can listen to broadcast FM in WFM mode.
400 channels instead of 200.
extended receive mod can be done of a novice . . . asleep . . . in the dark

I have them both. If I could keep only one, I'd go with the 43. I listen to
it much more often because of its portability. (I wish the 2006 had a remote
for changing channels! But, even then, I'd still go with the 43.)

2625. Books

Hi!

I've become a regular INMARSAT listener - two questions have arisen
from this:

1. Anyone have any schedules for AFRTS?

2. I've been busy profiling the bird and have a fair part of it's
activity mapped - does anyone have a formal layout of the thing's
channelization? (There're some channels which obviously carry only
data, but I can't tell if it's satellite telemetry, relay of
data from elsewhere or just housekeeping for the voice channels!)

If you should reply, please email me directly as well as posting to
the group. <lee@tosspot.sv.com>

Thanks,
Lee.

|> Intel Corp.
|> American Fork, UT

Now, come on Brett! :-) If you can find the groups and the hop sequence, trunked systems aren't that bad. Well, let's just say not so gruesome.

In New Jersey, they use Motorola's System 9000. They have a slew of channels (about 40 just for the trunked network, I believe), but there is a pattern. Look at the frequencies and try to pick out groups. In New Jersey, all of the frequencies that end in .4625 and .9625 belong together for instance. Pretty obvious, two sets of 1MHz spread channels, with each set separated by .5MHz.

Try listening at 8:00pm on a Sunday night. Enter every single trunked freq you have listed for an agency. Listen for a progression of transmissions that seem related. By listening then, it should be pretty boring, so you'll be able to follow the channel hops no matter how many you have entered. It could be something as simple as "453 to Headquarters" on one channel followed by "453." [seemingly in response] on a different one. Take down the channel numbers you have them programmed into, not the frequency. Only take the channel numbers down when you are positive about the call/reply and you can write both channels down.. not, "well, this is 86, and I think the original was on 114." It took me a few weeks of listening at dead times before I learned the sequence.

Now, these are logical frequency groups. It's quite probable that there are logical subgroups within those frequency groups. That's where you'll need the SCAN button. But only if you hear something that you absolutely want to follow.

I guess we're lucky in New Jersey since a channel hop only takes place if the carrier is dropped between transmissions AND data isn't broadcasted in with voice. The channels all sound like "normal" frequencies, it's just that the conversations are all jumbled up.

The general gist of NJSP's call sequence is, start with the highest entry of one of two frequency sets that make up a frequency group. The channel hops go down by 1MHz until the bottom is reached. The next reply comes in at the top of FREQUENCY GROUP PARTNER'S SET. Suppose you have A.4625, B.4625, C.4625, D.4625 and A.9625, B.9625, C.9625, and D.9625 with A through D being ascending progression. A transmission on D.4625 will get answered on C.4625 and so on through A.4625. Then that transmission will get answered on D.9625. The
^^^^
progression then continues through A.9625 which will of course get answered on D.4625. Down and switch, down and switch.

Point: You never know what you can turn up. Have faith.

There are two other widely available books out there that will serve the New Jersey and surrounding areas fine. The first is Betty Bearcat, which is available at most Uniden/Bearcat scanner dealers. The other option is Monitor America, which is much more comprehensive (and expensive). I am not sure who would carry it in New Jersey, but you could probably find out by calling the publisher (SMB Publishing @ 800-722-6701).

>RS couldn't provide much information..

>Also, they had a new scanner with 800 MHz (Pro 27?) for
>around $120. Any info/opinions on these? (It has only
>50 channels..)

I have a Pro-39 and I modified it to open up all the 800MHz freqs. I think the Pro-43 comes with the 200MHz militarie freqs, but the militaries freqs don't interest me much so I am happy with my Pro-39. The Pro-39 was on Sale last week for $50 off ($249US) and my friend went there a couple days ago (after it was on sale) and the guy said he would still sell it at the sale price. I got mine for $199 about 6 months ago on a sale from RS.

Hope I helped....

Thanks for the info, I did make some assumptions about already knowing which frequencies are in use, but I have never monitored a trunked system with more than 10 channels, so the hopping info is news to me. I figured it was random.

FYI General trunking assignments are made in 5 channel blocks, separated by 1MHz. So the first set might be 861.2375, 862.2375, up to 865.2375 The next block might be 861.5375, 862.5375, up to 865.5375. Often the 5 channel blocks have some association in the system, such as some agencies only use one 5 freq. block. This makes things a little easier to monitor.

>Umm, why not build in all the modules?

Good point. But I suppose the thing would become quite large. Another issue is that the manufacturers will cheat because they don't like diplicate components in the same box (not cost effective), so they will start combining things and we will wind up with "Uniden-like" scanners again.

Hi Franklin,
A few years ago the frequency 173.075 MHz was reported in USSN to have been allocated for the Lojack system. It would only be data type comms, no voice. I have not verified this frequency, and as far as I know, LoJack is only in use around Boston. I'd think if you find data on this freq and have any more info it would be worth a post to the net.

: While listening to the input frequencies of Denver's PD/FD, I
: will sometimes hear someone talk about going to channel x-and-such. Since
: this is a trunk system, I was wondering how this is possible.

The trunked system in Arlington is, from what I can tell, a collection of virtual channels. The police dispatch on what I think is 1A and use 1B for side-discussions (like a TAC channel). The point is that the radios follow whatever real frequency is being used for the "channel" that they are supposed to be using.

Regards,
Neil

p.s. -- the "switching over to 1B" stuff was *really* confusing before I bought a 800MHz-capable radio and was (unknowningly) listening to the 4XXMHz *relay* of the dispatch channel :-).

I think it would be interesting to know what frequencies they are scanning
to do this so that I could set up my MVT-7100 to perform effectively the
same function without having to buy their product? Anyone know these
repeater frequencies and/or how you would do this?

bae> Electronics of PSP, based in Harrisburg (who happens to be a
bae> neighbor).

Your LIST WAS GREAT, I am keeping it on file for future use. The problem I think is that there is MORE THAN ONE radio set up. Why, the 158.760/156.015 pair is most commonly reffered to as ch.32 in my area and used by for both phone patches (which is a waste as they never work) and drug task force by the AG. PSP in my area also has most of the other channels filled with local VHF agencies. There are 3 for Washington county alone.

My list came from a local PSP unit that I was able to get hands on use of, thanks to being a law enforcement officer.

bae> Far be it from me to assume that he was feeding me
bae> information that may not apply to everyone. I didn't intend to
bae> step on any toes - just trying to offer information that others
bae> on the Net might find useful or enjoyable.

Again, your list was GREAT. You didn't step on my toes, I wanted to point out some things that I am aware of with the PSP system in my area. It of course can vary as I said above. When I get asked about PSP I don't consider the PTC system or AG Systems as part of that as very few PSP units have these programmed unless they have a use. These systems are also under the control of other agencies OTHER THAN PSP.

Troop T has the PTC system as their primary frequencies. Troop S, which does the interstates might have the PTC's stuff if they have a turnpike interchange in the area. An example is the PSP Washington Troop S units. There is a toll road in their area PA SR43, so they probably have this programmed in.

How about we work together to maybe get your neighbor to get us BOTH some definitive answers on the PSP system.

I would LOVE to compare your channel use chart from an OFFICIAL source to the one AOSC members in my area & myself have compiled. I would be more than glad to send what I have to you.

Maybe the big problem is my writing style, so if it came off that I had "my toes stepped" IGNORE it!

I have an Yeasu FT-470. It can be programmed out of band (keyboard functions) and works very well in the VHF HI and UHF bands. It has no LO band VHF and no 800 capability and only 18 channels on each band - BUT - it can be had fairly cheap and will do double duty if you only want to (sometimes) carry one radio. It will search both VHF and UHF and does have a priority feature. I found mine at a Pawn shop for $250.

A TALE OF TWO SCANNERS

~~~~~~
The Pro 39 and the Pro 43: A General Comparison
by John Quill Taylor

~~~~~~

This is a general yet practical comparison between two popular Realistic(TM) Brand portable scanners, the Pro 39 and the Pro 43. This is not an in-depth technical comparison, as these have been written already. This is a comparison from my own experience using both scanners. I've had a Pro 39 for seven months, and a Pro 43 was just acquired recently, so my report is probably biased toward the Pro 39, with which I am more familiar.

Overall Impressions and complaints:
==================================

The Pro 39 & Pro 43 have some major differences and some subtle differences. The subtle differences can be surprising. For example, the beep confirmation tone is about one whole note higher in frequency on the Pro 39 than on the Pro 43! Also, each radio has its own "personal" behavior: the quality (or lack thereof) of its sound, the brightness (darkness?) of the internal lamp, and the ease with which you can read (or not read) the LCD display, all vary between one radio and another, even of the same model!

In MANUAL mode, both radios have a STANDBY feature that allows the scanner to consume less power, Both radios go into STANDBY mode after about 5 seconds. The STANDBY circuit produces and audible thump in an external speaker. When using an AC adapter (either charging or powering), an audible hum is heard when using an external speaker.

What's GOOD about BOTH the Pro 39 & the Pro 43:
==

Both of these radios share the same small footprint (more like thumbprint!). They use the same battery pack (6 AAs), AC and DC adapters (9V), and have a similar look and feel, including the antenna connector (BNC), earphone connector (1/8"), and squelch and volume knobs. Both radios can be modified to restore full 800 MHz coverage, and modifications exist to eliminate the beep and improve the sound.

What's BAD about BOTH the Pro 39 & the Pro 43:
===

Although a modification exists to defeat the beep confirmation tone, a switch to enable or disable it would have been nice. The sound of the beep

when using headphones or an external speaker is quite obnoxious, but the beep is somewhat useful during programming, since the buttons are rather small.

The belt clip is a piece of trash. Granted, it only costs a dollar to replace (at Radio Shack); I've spent three dollars more than I care to have spent on this weakly designed part. Luckily, its failures have not caused any damage to the radio itself, a very real possibility.

The internal speaker's in both radios suck.

On my Pro 39, I once was removing the batteries while the power was on, and I lost all the frequencies! I am unsure whether this can happen to the Pro 43, but I recommend turning the power off before taking the battery pack out and leaving it off until the pack is securely in place.

When in PRIORITY mode, the scanners often "leap" from a frequency with a solid carrier. Also, during the "sampling" of the priority channel, the radio often "misses" a pressed button, requiring you to press it again. These little "bugs" occur also on the Pro 2006.

What's GOOD about the Pro 39:
==========

The Pro 39 has a lower price.

The Pro 39 has a much easier to read LCD, at least on the radios I have seen. I returned my first Pro 43 because the display was hardly readable.

The Pro 39 uses less than half the current drain as compared to the Pro 43 (according to published specifications). This was my initial reason for getting a Pro 39 versus a Pro 43. Where does all that power go in the Pro 43? Is it the triple conversion? Is it the triple conversion? Is it the triple conversion? Who knows?

While the internal speakers are awful in both models, my Pro 39 has a much better sound. It is, in a quiet room, even "listenable." The Pro 43 speaker "cracks up" (this may be the fault of the audio amplifier, since both radios perform well with headphones or an external speaker).

The general "behavior" of the Pro 39 seems a bit more "positive" to me, although I have owned this radio much longer than my Pro 43. When scanning, pressing LOCKOUT works immediately on the Pro 39, while it seems to hesitate a brief moment on my Pro 43.

What's GOOD about the Pro 43:
==========

The Pro 43 has a few extra front panel features that are nice, like an AM/FM button. The Pro 39 "assumes" AM mode in certain frequency ranges, and this mode cannot be "overridden" with a button like the Pro 43.

The Pro 43 scans in both directions, from lower to higher channels (default "wakeup" mode, like the Pro 39) and also from higher to lower channels.

This is a subtle but very handy feature that allows you simple way to "bounce" back and forth between two closely spaced "hot" frequencies.

The Pro 43 features triple conversion (versus double on the pro 39). I didn't think this was a big deal, especially if you live in a "little" town like I do, and I still don't think it's a big deal if all you do is scan the programmed channels. Where triple conversion pays off is during searches, but since neither radio has "frequency lockouts" during search mode, both radios will "hang" on dead carriers, birdies, etc. during searches.

The Pro 43 has a shorter antenna (about 1/2" shorter). It is also narrower (about 1/8" narrower).

The Pro 43 "remembers" the channels without batteries, although many times I have left my Pro 39 on all night (after the batteries expired) and the frequencies were still there. Maybe I am just lucky.

The Pro 43 has better frequency coverage (see the Radio Shack Catalog).

The Verdict:
==========

The Pro 39 is less expensive but it only uses double conversion. The Pro 43 uses triple conversion, and yet it uses more power, has a more difficult to read LCD, and sounds worse using the internal speaker. While some great discounts can be had on both of these radios, I strongly recommend holding and operating both radios side by side before buying, and, if I had to do it again, I would buy them in person, since it appears that each radio varies in its LCD display and sound quality.

2657. Re: Mobile Scanner use in Canada

Newsgroup: rec.radio.scanner
Date: 1994-04-14 16:52:47 UTC
From: ad460@FreeNet.Carleton.CA
Message-ID: <Co9DK0.JoA@freenet.carleton.ca>
Source record: 275509

In a previous article, swilkins@isle.waterloo-rdp.on.ca (Scott Wilkins) says:

>Does anyone out there know if it is legal to use a scanner in a car?
>Whether it makes a difference if it's mounted/hand held

The following was extracted from an on-line information section of
Ottawa's Freenet that is supplied by the Spectrum Management Program of
Industry Canada. Since it is a pilot in Manitoba, much of the information
is specific to Manitoba, hence the Manitoba Highway Traffic Act reference.
I am not aware of any similar restrictions in the other Canadian
provinces, but would be interested in an updates others could provide.

The Computer Says:
The use of scanners to receive radio transmissions is not illegal. However, no
person is allowed to reveal the information that is received, or to use the
information for personal gain, without the permission of the originator. You
should also be aware that in the Highways Traffic Act for Manitoba, there is a
regulation prohibiting the use of scanners capable of receiving police
transmission in vehicles. The Criminal Code has restictions on the use of
information that has been obtained by monitoring radio telephone
communications.

About the Spectrum Management Program

The Spectrum Management Program's mandate is primarily to:

- manage radio use in Canada
- ensure the quality of the radio spectrum
- to have as many users and uses of the spectrum as possible

Industry Canada's mandate in the telecommunications field is
primarily to manage the radio frequency spectrum.

Source record: 275510
Cross-posted to: rec.radio.swap,rec.radio.scanner,alt.radio.scanner

Like the title says, I'm selling my BC 2500XLT handheld scanner.
I've debated long and hard, but I guess I don't _need_ it.

This is like new, in the box with books and warranty cards. Includes
case, charger/power supply and antenna. Only thing non-stock is that
I have ENABLED full 800 Mhz coverage (cellular) - so it's better than
new!

Some details - for those who don't know this unit.

400 programable channels
Turbo scan at 100 channels per second
Full coverage from 25-550 Mhz plus 760-1300 Mhz.
Key and "rotary" tuning, as well as search, scan and auto program.
LCD panel with backlight
Internal rechargable battery or runs on included 12V charger.

I think $225 plus shipping is fair..

|> I know that Motorola trunked systems have a privacy mode where two users can
|> grab a repeater for themselves, that no one elso can monitor. The
|> conversation will sound just like any other to the scanner listener.

That is precisely what NJSP sounds like. "Hey Tommy, go to five." [time]
"Ya here?" My question is, how does trunk control know which car to allow
into the private arena once the requesting car has set it up? In other
words, when Frankie asks Tommy to "go to five", how does the computer know
that Frankie only wants to talk to Tommy and when Tommy keys up? Is it
just a short time frame in which both parties have to hit "5" on their
control heads or what? What if someone wants to snoop? If they just hit
"5", will they block out Tommy if they hit it first?

Questions questions questions..

LOJACK is in use in the Detroit area also. 173.075 Mhz is the frequency I put in my BC200XLT priority channel for several weeks, I did not hear a thing. Detroit (the stolen car capital of michigan) does not have LOJACK in there cars. Some of the burbs no longer use them.

Happy Hunting.

Hi Wally,
Not any longer. Watch COPS every so often and you'd be surprised to see
how many episodes there are that show it blinking away on the dash. They've
been in NJ for some years and NYC just got approval about a year ago.

When you see a LoJack-enable cruiser, you think they went antenna-crazy, but
then you notice that they are in a special formation. The one I saw two
days ago was in a square, but I seem to recall seeing them in diamonds before.

** Disclaimer: All modifications are done at your own risk. This
product uses surface mount components which can be easily damaged.
Do not perform this modification if you are not experienced with
this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted
by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping
available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then
push upward on the bottom of the rear of the case, carefully
swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards
next to the interconnect plug in the lower right corner. Gently
pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. ** CAUTION!! Too much heat will damage the
shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder
and remove both.
6. Solder one chip jumper across the two upper most unused solder
pads. (Soldering a jumper across the lower two pads changes the
30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.

> While listening to the input frequencies of Denver's PD/FD, I
> will sometimes hear someone talk about going to channel x-and-such. Since
> this is a trunk system, I was wondering how this is possible.
> Is there a way to tell the trunking computer to create a virtual
> channel? Do trunk hand-held radios know how to switch to a simplex
> frequency?
> Being that I am at work, I have not been able to turn up my
> scanner to determine if I can recognize the person's voice who announced
> they were going to channel x-and-such after the announcement.
> Anyone have any information on this?
>
> ~Ken

Yes most trunked systems have a 'channel' capability. If your familiar
with fleets (PD would be a fleet and a FD would be another fleet), a
channel would be a subfleet. It hops around like anyother trunking
'channel'. For instance, detectives might operate on one channel while
still being part of the PD fleet. They are a subfleet. They will normally
only hear other detectives but they can also switch 'channels (subfleets)'
and talk to patrol cars.

> eclafl1@gl.umbc.edu
>
> Option 2: use the anonymous posting service (double blind) if you're still
> wary.

You should realize that it's not that people are afraid of answering you,
it's on account of the fact that most MDT transmissions are not decodable.
Unless you've got an MDT from the department of interest, you will probably
never decode an MDT transmission. The Motorola system uses a proprietary
signalling scheme (totally unlike anything else out there) and anybody
coming up with a decoder would be quickly sued. There's also some degree
of encryption built in.

Give up and live with the fact that you'll probably never decode an MDT
transmission.

Steve ⋆ JABBER v1.1 ⋆ Why isn't phonetically spelled that way?

>just a short time frame in which both parties have to hit "5" on their
>control heads or what? What if someone wants to snoop? If they just hit
>"5", will they block out Tommy if they hit it first?

I'm not sure about the snooping, but they hold down a button to be included in the switch over. The snooping is not really an issue since the setup already excludes the groups that shouldn't have access to the police channels. Other police officers may be able to sneak in, but I doubt the conversations are that private anyway. Many trunk systems, and most ALL police radio systems have a tape running on all channels at all times, so everything gets recorded.

NIFERN...154.2650 (mutual aid fire)

DuComm Fire North...154.1750
East....154.4150 (repeatered)
154.1450 (simplex)
West....154.3100

(Covers most of the towns listed under
Ducomm Police)

Downers Grove Police...470.5125

DuPage Co. Sherriff..852.6625 (primary)
854.9625 (secondary)

What else?
Jerry

P.S. Call the BBS down at the tagline. Loads of frequency info here.

2667. Newbie question - Pro 39 & Cellular

Newsgroup: rec.radio.scanner
Date: 1994-04-14 19:21:09 UTC
From: Jerry.Smith@f747.n115.z1.fidonet.org
Message-ID: <2dae1836@f747.n115.z1.fidonet.org>
Source record: 275520

sg> I have a Pro 39 that has 800 capability. Can it monitor Cellular ?
sg> What is the Freq Range for Cellular ? Thanks........

Scott...Frequency range for cellular is 869-894 Mhz. The '39 can receive cellular after a modification posted below...

Product: Realistic Pro-39
Purpose: Restore full 800 Mhz continuous coverage

Modification is from the January issue of Monitoring Times- January, 1993-page 107

** Warning...This procedure may void your warranty.

** Do not attempt this modification unless you are familiar with small component soldering. Performing this modification is done at your own risk.

** This modification restores certain portions of the 800 Mhz band that is against U.S. federal law to monitor.

A fine tipped soldering iron, desoldering wick, small Philips screwdriver, long-nosed pliers and rosin core solder are required to perform the mods.

1. Remove the battery door, holder and batteries from the unit.

2. Remove the four screws from the back of the scanner and carefully lift the back off.

3. Unplug the two wiring harnesses at their connectors and remove the six bright colored screws holding the circuit board in place. Unsolder the ground wire from the lower right corner of the circuit board. Unsolder the two wire connections from the BNC antenna connector at the board. Carefully lift the board (grasping it near the Molex connector) and set it aside.

4. Remove the two bright colored screws from the next circuit board. Carefully unplug the two-wire connector. Unsolder and lift the rectangular metal shield exposing the diodes.

5. Carefully unsolder and remove diode D6 only; this will restore the missing frequencies which can be searched in appropriate 30 khz steps.

6. Reverse procedure to reassemble unit.

Jerry

2668. PRO43: What's with all the interfenence?

Source record: 275521

al> My PRO43 is GREAT at every band except one. 155-160 MHz. For some
al> reason every timme I listen to trains in the Bay Area, I get nasty
al> interference from the local NOAA weather station. It is almost always
al> up 1.2 MHz from what I want to lister to.

al> It isa real nasty combination of tones and reduced voice. When I went
al> to Roseville, I got great train reception with no interference. But,
al> when I came home, it all started over again.

al> Any ideas about why, or how I could stop it?

Hi, Albert...

Unfortunately, your complaint is a common one for the PRO-43. The
interference you describe is known as intermod...the mixing of two or more
radio signals. The cause of this is usually from the receiver being
overloaded by radio signals. Sometimes, an attentuator will solve the
problem. (Radio Shack sells one, though you will have to modify the
connections)
Most scanners receive intermod to some degree. It is most apparent
when monitoring in metro areas where there are plenty of radio signals that
can sneak in.

Detroit (the stolen car capital of michigan) does not
have LOJACK in there cars. Some of the burbs no longer use them.

True, but the Detroit PD and most Suburban departments never
did outfit their units with LOJACK. The Michigan State Police
units in the Detroit area have a number of vehicles equipped with
LOJACK direction finders. A casual scanner listener may well never
hear the signals unless they are in their immediate vicinity, as
the signals from the activated transmitters are rather low power.

The tones that you are hearing are most likely an indentifier. Alot of places
use these instead of having to identify their call letters and location by
voice ever 30 minutes. Much like a radio station does at the top of the hour.

Not that I would condone such activity, but there is a quick and dirty way to monitor MDT's using a VAN ECK device and a Yagi antenna. Most but not all MDT monitors are of the green or orange phosphor type and can be received by VAN ECK devices up to a few hundred feet. The caveats of such monitoring are obviously getting caught, you must follow the PD cruiser around or find a stationary cruiser, or park a couple a hundred feet from the PD and try and use it. Note: I have never attempted these courses of action, these are just some ideas I have mulled over. I am currently building a VAN ECK device from plans bought from Consumertronics.

I don't know the details of the VAN ECK device, but would it still work if the
police MDTs were using LCD screens instead of CRTs? I know some MDTs do use
LCD screens instead of CRTs.

800Mhz trunk systems usually use Morse ID's but maybe you didn't intend to
include ID's in you question.

I've seen the square antenna formation on a number of Cobb County (Atlanta
suburbs) police cars for 6 months or more now. Wasn't until a couple of
months ago that I could get a good enough look inside one of those vehicles
to prove my theory that they were for the LoJack system.

-->wondering if some ofyou more technical types might have an some ideas
-->about this system
-->Thanks

The system on the police cars is used for directional finding the transmitted signal. Go to any ham clubs in your area and ask about T-hunts. Some of the simple ones (novice level) use a handheld with a rubber duck. With the body sheilding the signal, one finds the direction of the strongest signal, actually the weakest signal and you back is toward the srongest signal. This works except if the transmitter is hidden in places where the signal is reflected by other objects. Advanced T-hunts use directional finding equipment and beams that can find the direction. The system used in police cars is a directional finding system that enables the police to track the signal rather easily. LAPD uses that system and I have heard the officers report they have located the signal and seen the car but the theif slipped down some street and doubled back to out run them. Well the police radio is hard to outrun. Backup is called and the crook is caught or at least the vehicle is recovered and the person fled somewhere on foot.

By all means, if a local ham club is having a T-hunt, then go. Even if you just watch, you might find it interesting.

for lon/lat info on _any_ us location, a good source is aeronautical
charts. in your case, come on over to the palo alto airport where there
is a pilot supply store. they sell charts in several scales depending upon
the degree of detail you need.

charts also show plenty of landmarks, buildings, roads, slac.

they are quite accurate and are revised twice a year.

palo alto airport is on embarcadero rd. on the other side of us101 from slac.

2694. Icom R1 (.5-1300MHz) for sale

Newsgroup: rec.radio.scanner
Date: 1994-04-15 17:32:15 UTC
From: r_egeland@cc.colorado.edu
Message-ID: <2omj2v$jh9@lace.Colorado.EDU>
Source record: 275450

I am selling my Icom R-1. I don't really listen to anything but police and ham radio, so I find no need for it's extensive features.

For those unfamilliar with the R-1, the following is a list of features (from my memory):

- Full coverage from 0.5 to 1300 Mhz
- Smallest scanner produced (about 2" x 1.5" x 4")
- Wideband FM (TV, Radio), Narrow FM (police, cellular), and AM modes for any frequency
- 0.5, 1, 5, 10, 12.5, 25, 30, and 50 kHz step rates (receives any form of transmission)
- Programable Search limits (ex. will search from 860-890 MHz), with any channel spacing (useful for cellular - will effectively scann every single cellular channel while only taking up two numers in the memory.
- "Search and Store" function - searches for activity in a specified range of frequencies and stores any found (great for finding unknown frequencies)
- Runs about 8 hours on internal battery, or runs for days with optional battery pack (I don't have that, though)
- All kinds of other functions that I haven't even learned how to use yet!

The scanner has ALL accessories, as well as the directions, box, and packaging. I think the scanner retails for about $400 from Grove (I'm not sure of the exact price, but it's somewhere around there - check for yourself). I am selling the unit for $295, which seems to be the average price on the net. The scanner has no scratches or damage of any kind.

Please respond directly to me.

Source record: 275451
Cross-posted to: rec.radio.swap,rec.radio.scanner,rec.radio.shortwave,alt.radio.scanner

I have two brandnew Yupiteru MVT7100 "assault radios" for sale. These are brand new in the box, and even sport an English Language manual (well a new japanese manual and a copy of an English manual).

I have one brand new carrying case (Yupiteru vinyl case) which is damn nice to have to have to prevent the little numbers on the push buttons from wearing off.

The scanners are $700 each and the case is $30. Buyer pays shipping. I can zip off by FEDEX 2nd or whatever other way you prefer. These will not be importable after April 26th under any circumstance and have full coverage (including cellular).

They won't last long os if you want one, don't hesitate.

> > Is there a way to tell the trunking computer to create a virtual
> >channel?
Virtual channels are the whole idea of a trunking system. The "modes"
selected by the user are completely independent of the actual frequencies
used. You might only have 5 channels, but have hundred of users and
talkgroups.

> >Do trunk hand-held radios know how to switch to a simplex frequency?
Conventional modes can also be programmed into many models of radios, but
these are never "trunked." The user must manually switch to simplex
frequencies.

> > Being that I am at work, I have not been able to turn up my

> I know that Motorola trunked systems have a privacy mode where two users can
> grab a repeater for themselves, that no one elso can monitor.
A "private call" establishes a private virtual channel. It is trunked,
however, and may also change repeaters as a normal talkgroup call would.
Only 12 kb "Securenet" or 9.6 Kb "Astro" with encryption would make the
conversation really private.
> The conversation will sound just like any other to the scanner listener.
> Another possibility is that the system has a channel designated for chatting

>
> While I'm on a roll here, let me add that another feature used
> by police is a "capture" feature. They can press a button and hold a repeater
> so it will always be available.
This feature set is called "Emergency." A signal will be sent to the

dispatcher to let them know that a unit is in trouble. The ID of the unit
will flash on the console display. All sorts of audible alarms will go off
at the console positions. The unit ID will flash on the displays of "Astro"
display equipped subscribers. The voice channel will only be used for the
emergency call. Other traffic won't be assigned to that channel.
> In a busy system, it could be very dangerous

Some Portland, Oregon police cars have a 4-antenna grouping on the roof, some on the trunk. Also a compass-like display sitting on the dashboard. Could be LoJack, I suppose. With a cellular pigtail on the back window and a comm antenna on the trunk, these cars are a rolling antenna farm.

How does a citizen go about getting a transmitter placed in the car so it can be located in the event of theft? Is there a monthly charge for the service?

The original chrystal was either being removed entirely and replaced with either a 6.5 mghz or a 6.5536 mghz chrystal. Or being left in, and the additional chrystal was added. A toggle switch was also added to separate between the two chrystals. Once modified, you could use the dialer as both a regalur dialer as it was intended for, or a red box, which would simulate within an acceptable tolerance range, the tones which the phone produces as change (each tone=one nickel) was being dropped into the payphone. Simply put it is a toll fraud device built with parts easily available for less than thirty dollars.

At just $1.99, and written by the Pop Comm folks (or some connection with
Pop Comm is mentioned on the cover), it looked like a pretty good deal.
But I looked inside and the only ads in it are for Radio Shack. The
articles too cover Radio Shack equipment. My opinion after a closer
look: They should not charge money for this advertising piece.

Source record: 275464
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Although not a UK user, I thought my experience might be somewhat useful anyway. Some of it will be inapplicable in the UK, of course.

I ordered my MVT-7100 from Radio Lorenz in Montreal. It cost CDN$749; express shipping was CDN$51, for a total of exactly CDN$800. For this I got the radio itself, a belt clip, an earphone, a wrist strap, a telescoping antenna, four AA nicads, a 12V car adapter, a wall transformer, a manual, and a 1-year warranty. According to its markings, the transformer is rated for 117V in/12V out, so is not the 100V transformer some have complained about. The manual was the original Yupiteru manual; I didn't get a copy of Jonathan Clough's rewrite. I had no trouble understanding the Yupiteru manual, though.

Good points (aside from receiver performance): the green backlit keyboard is pretty; 50 Hz tuning steps make it pretty easy to get reasonable-sounding SSB reception; scan and search speed is adequate.

Bad points (aside from receiver performance): the radio runs a little warm, and is a power hog; tuning even finer than 50 Hz could be useful on SSB; there is no stereo reception on broadcast FM.

Receiver performance: I used a Radio Shack center-loaded whip, advertised as `suitable for 25--1300 MHz'. There is no LW broadcasting in the US, so I can't comment on LW reception. MW reception is OK for local stations although nonexistent for DX (not to be expected without a real MW antenna.) I put it next to a Sangean ATS-800A to check SW performance. They seem comparable, although I think the Sangean has somewhat better selectivity. I was able to copy CW, AM and SSB amateur transmissions on the 80m and 40m amateur bands; 11m CB also comes in. VHF and UHF sensitivity seems OK, at least up to 1 GHz or so.

More remarks on receiver performance: I have tried the radio out here in Berkeley, CA (a highly populated area) and in Mansfield Center, CT (a less populated area.) In both places I've noticed that VHF/UHF signals can often be received 455 MHz above their nominal frequencies. In Berkeley, there are additional problems. Images (I presume) of broadcast FM can be heard at various frequencies between 165 and 170 MHz, and one particular VHF user's signal---somewhere around 43 MHz, I think---can be heard everywhere from ~30 to ~50 MHz, overriding the signal actually present; in fact, this signal can even be heard on shortwave at times. Using the provided telescoping antenna instead of the Radio Shack whip, the offending signal quiets down a bit and can only be heard from 35 to 50 MHz or so.

I found this last problem so annoying that I sent the radio back, hoping that it had some obscure defect, but unfortunately, M. Lorenz says it checks out OK.

Has anyone else had this sort of problem with the MVT-7100? Would it be worthwhile trying a new unit, or should I ask for a refund and look at something else? And what of the MVT-8000 that someone mentioned in this group? Your advice would be appreciated, as the April 26th deadline looms near for those of us in the States.

2709. Batteries LEAKED! Please HELP!!!

Newsgroup: rec.radio.scanner
Date: 1994-04-16 03:22:42 UTC
From: boothc@kenyon.edu
Message-ID: <1994Apr15.222242.10548@kcvax1>
Source record: 275465
Cross-posted to: rec.radio.scanner,rec.radio.amateur.misc

I seem to have a serious problem. My girlfriend mistakenly unplugged my Pro 43 with normal energizer batteries and placed the plug in the charge jack. To cut to the chase, my baterries leaked a bit. Fortunately the scanner was in an upright position so it did not leak "up" too far. I just discovered this, but decided to take off the back cover before I proceeded. The acid has discolored the bottom circuit board (the one on the side facing the keypad just below the battery contacts (where they connect).

How do I get the acid stabalized and hope fully removed?

Please e-mail suggestions to me asap because our newsreader downloads news packs once or twice a day. I believe time is of the essence.

Carter

Someone at my place of employment told me that he was a member of a scanner notification service in Virginia that was tied into several other notification services. He said that monitors in just about any East Coast city could call an 800 number and report an incident to the "dispatcher", who would then send the info out over the members' alphanumeric pagers. He believes that the pagers were leased from SkyPage.

Is anyone familiar with this wide-area system? I would like to contact someone about the details of hooking into the network, if it exists.

Check out oak.oakland.edu::/pub/hamradio/docs/misc
I might (not so humbly) recommend:

scanner.faf
Details of the most often requested bands. Includes channels, frequencies,
and usage notes for: cellular phones; cordless phones; television;
citizens band; railroads; marine VHF; NOAA weather.

fcc.allocations
A summary of the FCC Table of Frequency Allocations for the 30 - 900
MHz range. Since it boils 90 pages of data down to 140 lines, a little
detail has been lost <g>, but it will guide a scanner user to what's where.

Its my understanding the 7100 is a good scanner (>30mhz), but not a good shortwave receiver (<30mhz). I tried to get the best of both, on a budget. I bought a used PRO-2006 ($250) at a pawn store. And a used Sony 2010 ($220) here on the internet. Both of these are on the verge of going out of production. Hope their will be some equivalent replacements in the future.

In article <2onj16$4ea@vixen.cso.uiuc.edu>, dhughes@prairienet.org (Dan Hughes) writes:

To those who are being critical of RADIO!:
Yes, Radio Shack is the primary advertiser in the magazine (notice there also are ads for CQ and the ARRL inside). The magazine is not designed to be technical in nature (there are other markets for that). RADIO!'s primary focus is to help others learn about the radio hobby while they are visiting their local Radio Shack store. For instance, a CBer visiting their local store to pick up a connector and may pick up the magazine and read about shortwave listening. The next time in the store, s/he may decide to get into the hobby of shortwave listening if the articles were of interest. So before you are critical of what Radio Shack is doing, keep in mind it also is serving a public interest in that it is exposing the radio hobby to others. The radio hobby has so many facets and there is room for everyone. The second edition of RADIO! already is being put together for this summer and I invite everyone to pick up that edition, too. And for what it's worth, the ads in RADIO! are so slick that it would be great to see some of them appear in general interest publications. They spent a lot of time making those ads and they need wider exposure (and more exposure to the radio hobby). 73,

Not so... For a HANDHELD, the MVT-7100 is very good <30Mhz No, it can't
compete with a base unit, but I can listen to the major b-casters while
walking around the house with the stock whip antenna, and I have picked up
military and ham on SSB, etc. I'd say the issue here is HT vs base/mobile.
For an HT, there is nothing I've heard of that comes close to the 7100

Yep, you guys still have a few days to give Jonathan Clough your money and
hope that it gets here before the 26th. You also have a bit of time to
spend a couple thousand dollars to go to Tokyo and buy one yourself.

Or you can either take your chances with customs after the 26th, or pay
market prices.

The way miniaturization is working, it may well be possible to stop the box from getting too large. If the idea is sound, there'll be some manufacturer who do it and charge a premium to those who appreciate the quality (or so I'd hope. Guess we need a class below novice . . . naive!)

Radio Shack has the CTR-76 voice activated recorder on sale for $35.
(regular $50). Its 7" X 4" X 1". Its got a mic in, ear out, and remote
input. The 6v AC adapter is $8 extra. Its speaker sounds very good.
It sounds *much* better than any walkman sized recorder I've heard.

I had looked at the walkman sized ones, but they were a pain to deal
with the controls with the two cables (mic in & power cable).
The desktop recorders just take up to much room, this ones just right.

Unfortunately the "hang time" of the voice activator is nine seconds.
This is to long, wastes tape between police call transmissions.

DOES ANYONE HAVE SCHEMATICS FOR THIS YET?

WHAT RESISTOR CONTROLS THE HANG TIME?

If no one responds I may buy the schematics and figure it out my self.

>interest in that it is exposing the radio hobby to others.

Chuck, I think you missed my point. I have no problem with the lack of
technical info in the magazine--I have a problem with Radio Shack charging
money for what is in essence a printed infomercial for Radio Shack. If
they REALLY want to help others learn about the hobby, they should give
the magazine free and expect to make the cost back from sales generated
by the articles and ads in the magazine. People not already interested
in radio are not likely to spend money on a magazine about radio, but
they might well read if it were tucked into the bag with their purchase.

2736. Re: INFO ON THE ICOM R1

Newsgroup: rec.radio.scanner
Date: 1994-04-17 04:04:11 UTC
From: csdfg@selway.umt.edu
Message-ID: <1994Apr17.040411.931@selway.umt.edu>
Source record: 275394

I bought my R1 about a year ago, and am still very glad I did. I wanted it mostly for its wide coverage up to 1300 mHz, no gaps. The price was right ($430+ at that time, from Universal Radio). ICOM's good reputation was another influence on my choice, besides the fact that it's also a very attractive looking unit. Initially, I was a bit unhappy about the front end overload it is subject to in high signal areas (like across the street from the police station or the local paging repeaters), but have since found that I can adapt to that situation somewhat by turning the squelch very high. Fortunately, I am not usually in the above mentioned high signal areas. While it's selectivity isn't nearly as good as a good table top set, I continue to be more than happy with the R1's sensitivity. I replaced the rubber duck antenna the R1 comes with, with a collapsible one from Radio Shack for under $10, as the duck's performance under 100 mHz is less than adequate. The RS antenna improves the R1's reception of shortwave signals more than I expected. On shortwave, you can expect to hear the major international broadcasters, but probably no DX. Since the R1 has no SSB capability, most ham monitoring (except for some CW) is out of the question. It performs downright poorly <5 mHz (I can hear WWV at 2500 kHz sometimes, and the in-town MW broadcasters). I have not received anything below the AM broadcast band. I don't worry about any of that though, because I have other radios for those bands. I would have bought the R1 with only 25-1300 mHz coverage.

Overall, it's a great little unit. I think its strongest selling point is its extremely small size and compactness. I take mine everywhere except the shower. Its extreme portability seems to encourage that. An _outstanding_ performer, tecnically speaking, it is not. If you want a better performer, there are other choices. However the R1, despite its shortcomings is no slouch either, and it's got a built-in stealth factor, thanks to its size. I'd buy another in a the wink of a flirtatious eye.

> Jerry
> * Evaluation copy of Silver Xpress. Day # 0

Cellular calls operate on a full-duplex transmission system. The xmit from a celltower --> phone (forward channels) are exactly 45Mhz appart from the phone --> celltower (reverse channels). The only reason you may be able to hear both sides of a conversation while tuned to only one channel is that the microphone on the phone is picking up what's coming up on the receiver speaker of the same phone. You'll notice that phones like the motorola flip don't have a mike on the 'flip' mouthpice, but it housed internally with only a tiny hole to the outside world! Tuning to the tower freqs get better results because the towers put out more than a measly .6-2.0 watts tht the phones do.

You could try wiping it with a moist paper towel or Q-tips. If the
battery section is removeable or separate from the rest of the
radio, rinse it with water and rub any stubborn spots with Q-tips.
My theory is that you want to remove all those corrosive and hopefully
water-soluble chemicals.

The battery contacts also get corroded, and any plating on them may
be gone. Go over them with fine emery cloth, or a pencil eraser.

Good luck,
Jim

2745. HT with extended RX (and the winner is . . .

Newsgroup: rec.radio.scanner
Date: 1994-04-17 17:15:05 UTC
From: gdallal@world.std.com
Message-ID: <CoEyL7.Fws@world.std.com>
Source record: 275403

And the winner is . . . the Standard C558A, even though it lacks the Yaesu FT-530's lighted keyboard and dual in-band receive and cost $120 more.

I was *all set* for the Yaesu. It had many attractive features missing from the Standard, and while some intermod problems had been reported, I decided they weren't critical because, while I work in Boston, I live outside the city. Other hams have Yaesu's and argue that where intermod is most severe (the towers on Route 128) there's no HT that doesn't suffer some intermod. People who wrote to me about Yaesu's were *truly* enthusiastic about their units. The people at HRO were enthusiastic about Yaesu's; even the salesman who admitted he thought the Standard was a better unit had a Yaesu on his belt (he bought it before the 558A was available). The unit clearly had a nice set of features, the best bang for the buck, and was manufactured to high production standards.

The choice was clear. Get the Yaesu. The lighted keypad was a big plus. The dual in-band receive had important consequences for scanning as well as for hamming. If intermod turned out to be a problem, I could move up to the rumored Standard when it came out and would probably take a smaller financial loss selling the Yaesu than the Standard (if, in the meantime, one of my sons didn't get licensed and get the unit as a hand-me-down). My credit card was in my hand.

But there was one *little detail*. As I reported publicly and mentioned privately, I was going to compare the HT's against my PRO-43 to see how they functioned as makeshift scanners. As luck would have it, HRO had a used FT-530 for sale, and *it had been modified for extended receive*.

It is illegal to listen in on cellular frequencies, but, I believe (and others more knowledgeable should comment) one exception to the rule is for the purpose of antenna testing. So, we set the volume and squelch on the Yaesu and the 43 and got ready to see just how many transmissions each would lock on as we went up the band.

No company publishes specs for out-of-band behavior. Even though the Yaesu has steps of 5, 10, 12.5, 15, 20, 25, and 50 kHz in band, in this particular range it would allow steps of 12.5 kHz only.

This is a political issue for me. It is illegal to listen to cellular, so I do not listen to cellular. However, I, along with many others, believe that this law is foolish and inappropriate because if signals pass through our bodies, we should be free to listen to them as we please. (Some would say we should be free to do *whatever we want* with them.) I also think there is a good chance that as soon as this law is tested in federal court it will be found unconstitutional. For this reason, I do not wish to own any equipment that has been permanently crippled like the FT-530, if an alternative is available.

As far as I can tell, the Standard is not crippled this way. Its steps (the same as the FT-530's) appear to be available for out-of-band RX. And so I purchased a 558A.

If I acted too hastily, it's only that I probably should have given the IC-W21AT some further consideration. Having decided earlier that the FT-530 overshadowed the W21-AT, I neglected to move it back to the list of possibilities when the FT-530 was eliminated. The W21AT, too, has lighted keyboard and dual in-band receive. I didn't check out-of-band step sizes, though.

Lee I read your post with interest and tried to e-mail back but it bounced
I'd be most interested in hearing about your receiver, antenna, etc that you
use to pull in INMARSAT signals and what your experience has been in what you
hear on that bird. I'm quite interested in trying to monitor this bird and
I'm looking at what options (preferably cheap) I can use. Down East Microwave
has a loop yagi and pre-amp for 1536 mhz and I'm looking for a downconverteer
as teh cost of an ICOM R7100 might include a divorce lawyer. I'd appreciate if you could
e-mail me at anton@fraser.sfu.ca, post again with a phone number or call me at
604-755-3447(days) 604-758-3038(evenings) Pacific standard. I'm hoping to
try pulling in some military comm sats today if the PRO2004, pre-amp, and
antenna come together and I point in the right direction. Hope to hear from
you (or any other INMARSAT afficionados)

Chris Anton

I'm not sure if RS is completely to blame here. Before they started charging for the catalog, it was quite common for employees of RSs located in malls to take a pass through the mall at the end of the day to see how many catalogs they could recover (left behind, in part, by people, dragged along to the mall by another family member, who used the catalog as a diversion). I wonder if the same considerations were in effect here. (In the same vein, I'm real curious to learn how charging for the catalog affected sales. On the one hand, they saved on catalog costs; on the other hand, . . .)

RS isn't alone here. About 18 months ago, SONY started charging $5 for their catalog of consumer products. They even took out ads for it. Did anyone actually *buy* one?

I guess I can look at it two ways, folks....

No. 1 -- If you don't wanna pay for it, let the RS dude whose picture is inside the magazine know. Write him a letter stating the same.

No. 2 -- The price is about half of what any other radio magazine runs, so they are cutting you a break to begin with.

Believe it or not, but if every Radio Shack store sells out of their allocated copies, the circulation for RADIO! will be well more than any other hobby radio publication, including the ham magazines.

And for what ever it's worth, I would be willing to accept story ideas on things you'd like to see in the upcoming editions. If it works for me and the other editors, we'll give it a try!

The Radio Shack stores around here still give the catalogs away--they
just rip out the $3.00 coupon and "pay" themselves for the catalog with that.

Source record: 275410

I was just down recently in Peurto Vallarta, Mexico and brought down my
Pro 43 scanner with me .. Well I have a list of frequencies that I heard
but dunno what they are.. most of them were in Spanish.. I know some
are marine frequencies but the rest i wouln't mind finding out exactly
what they are..
Well here there are..
157.125, 156.700, 157.425, 150.390, 149.800, 158.300, 148.675, 156.450,
149.625, 158.300, 157.850, 156.750, 156.650, 160.450, 150.440, 156.400,
163.725, 155.025, 149.840, 166.425, 148.125, 162.080, 159.950, 162.600,
150.075, 156.000, 156.000, 157.850, 158.500, 148.800, 150.440, 156.875.
159.825, 148.075, 155.025, 156.950, 157.100, 155.520, 165.525, 156.375,
156.050, 156.575, 156.800, 155.950, 158.775, 158.025, 171.580, 156.975,
165.400, 151.275, 156.325, 158.775, 165.100, 143.950, 149.800, 157.175,
165.100, 143.750, 143.600.

Well all those frequencies are voice for the exception of..
150.390, 151.2750 which sounds like some kind of data bursts.
and 143.950, 143.600 which were a constant tone..

I wasn't in exactly the city of Peurto Vallarta either but in a
little village east of it called Mismoloya.. Well any help in iding
these freq's is appreciated.

Matthew

2755. Cheap scanner antenna project idea

Newsgroup: rec.radio.scanner
Date: 1994-04-18 10:39:32 UTC
From: brucehd@ids.net
Message-ID: <1994Apr18.053932.1@ids>
Source record: 275413

Here's a cheap, quick, and although a bit ugly, excellent performing antenna idea for scanner users for vhf and up.

Parts:
10' 1-1/2" pvc pipe
10' multi-conductor rotor control cable
52 or 75 ohm coax (as much as you need, recommend lightweight stuff)
proper connector for scanner
electrical tape

Cut the piece of rotor cable in half. Strip all the conductors on one end of each and twist them together. Carefully strip one end of the coax about 1". Use a comb to unbraid the shield, and twist the strands together. Strip the center conductor about 1/2". Solder the shield to the twisted end of one of the halves of rotor cable, the center conductor to the other. Insulate with electrical tape, such that the two halves of rotor cable and coax form a "T." (Ensure the two sides don't cross.)

Now the number of conductors the rotor cable should have should equal the bands you wish to monitor. Determine a central point between the frequencies you wish to monitor in each band. (For instance in the VHF/Hi band, I usually listen to freqencies between 156 and 162 MHz, so for that band I chose 159 MHz as the center freq. Also, since my scanner is an inexpensive model covering VHF/Lo, VHF/Hi, and UHF, I opted to use a three conductor rotor cable.) Use the formula, 468/(center frequency in MHz), to determine the overall length, from end to end, for each pair of conductors. The longest length would be about 10', which centers above 40 MHz, but works well for the whole band just the same. Cut each pair for each band as you go up in frequency.

Stretch the entire antenna along the the length of the PVC pipe and secure it with the electrical tape. Also tape over the ends of each conductor to seal against moisture. Wrap the center where the coax is connected in an "X" pattern to provide strength and support to that spot.

Mount the antenna vertically. I mounted mine to a sewer vent pipe with the remainder of the electrical tape. It's ugly, but it has been up almost two years and has withstood all sorts of nasty New England weather. I know someone who mounted hers to a fire escape with a couple of hose clamps. Whatever works.

Guide the coax to your radio as neatly as you can, attempting to keep the coax as perpendicular as possible to the antenna. Cut the coax to

length and attach the connector.

What this is is basically a multiband vertical dipole. It will easily outperform a discone in the bands it is cut for, and just about any other scanner antenna out there. I know two hams who use the same design for the 2m, 135cm, and 70cm ham bands (using good quality RG-8 style coax to minimize transmission losses).

Total cost should be less than $10.

Have fun.

Well, that is what the Code of Federal Regulations says, but I'm sure there
are exceptions. If it is a leased system, the channels could be all over the
place.

For some reason, my outgoing email isn't working...

I'm no chemist, but I think baking soda (maybe mixed with a little water)
should do the trick. I know it works with car batteries (lead acid), but I've
never tried it with alkalines.

hi everbody!
scanning cellular phone frequencies is illegal in most countries....
so here is a list of cellular phone freq. you should NOT!:-) enter into your
receiver/scanner (depending on where you live)....
i found this listing in the '92 PROCOM antenna catalogue. it's not very
up to date but i think it will tell you where NOT!:-) to scan .....

have fun:-)....
Harald

> have LOJACK in there cars. Some of the burbs no longer use them.

Look closer there are 85 cars in detroit alone that have lojack.
Most units are in the IOU division. 800 trunk I hear them finding
cars all the time. All the suburbs also have it. Most are installed
in undercover units. Note the 4 18" whips are no longer needed.
The ant is in the roof now. As far as 173.075 it is a good freq.

Varified it using a PRO-43 (My job involves public safety) and
found range to be only 600-700 feet with the scanner. The lojack
unit is aprox 1/2 mile.

Isnt Detroit area easier to monitor now that most departments
have gone to the 423-425 mhz band....

Happy Monitoring

2760. Selling CA freq guides

I have moved and no longer need a few of the frequency directories from
California.

1. Robert Kelty's (Mobile Radio Resources) "Government Radio Systems"
This book is a few years old (6th edition?), but most frequencies are still
accurate. This is the big greenish-blue guide that covers all of California
in lots of detail. New it cost about $30, I am asking $10.00

2. 1993 FCC microfiche for California. I think there are about 13 fiche. I
bought it from the Bearcat Radio Club last year for $15. Asking $5.00

I'll probably find more stuff as I unpack, but that's it for now.
Please e-mail replies.

I thought of another reason not to put all units in one box. With that many oscillators, crystals, processors, etc, you'd have birdies all over the place!

The BCT-2 scanner has the ability to pick up locater beacons
that most HP's have installed in their cars. I have a friend
that just got one and I am very anxious to see it work. If
it works the way I thing it does I will not need to use
my radar detecter any more. The scanner will alert you to an officer
in the local area. I hope that helps.

[stuff deleted]

I thought that this was a function of the link to the phone system and that some phone systems would echo back the caller's voice as well as that of the callee. I don't think that this has anything to do with the physical design of the phones. I'm under the impression that it's kind of the difference between "local echo" on a terminal and having the remote system echo the keystrokes. Many times the remote phone system echos back your voice so, just like on the remote computer that shows you its output as well as your keystrokes, you hear your voice and that of whomever you've called.

If I'm wrong about this, maybe someone who knows for sure can chime in.

The Oakland Police are having a lot of trouble with these new radio's. Oakland installed there GE system last year and apparently the police radio's keep going in to the emergency mode and so forth. A detective told me that these radio's are a real hassle so I guess the technology isn't working as well as they thought it would.

I have one of these (I think - is it the one with 3 ground radials, two little vertical elements, and one 15" vertical element??) anyway they cost about $15 and work just fine. You are not going to pull in weak signals, but for general scanning it works well. A well kept secret is that these have good SWR on 2m and 440 for transmitting!! (I tested it).

Jerry,
Nice to meet you on the here on the net. I read with interest your list of freq's in DuPage county.

I often listen to DuPage County Sheriff, Woodridge, Naperville and Lisle.

The parts I do not understand are the signals and codes used. For example, a DPS might say a "181" or a"330." Woodridge might use a four digit code. Where can I find a list of these codes.

Thanks in advance for your help.

Bill, NA9I

Just be aware that if you do so, that you must bring it in before the 26th
is over and that you will pay an import duty. If you bring it in after the
26th, you will be smuggling contraband.

I understand heroin is very cheap in Bangkok Thailand, but bringing it
into the US is a risky affair indeed! I certainly do not recommend it.

By the way only one of the MVTs is left now and the carrying case is gone
too. You guys may like to complain about someone making a slight profit
but when was the last time you were willing to tell your employer you
did not need your paycheck? Or when did you suggest to your grocer
that it was immoral to make a profit on a necessity like food?

There is a science of the allocation of scarce resources. It is called
economics. You may find it to be an interesting source of information
of free market dynamics.

> Over here on the N.E. side that borders Macomb county the burbs did
> in fact have LOJACK and still have but it appears in fewer quanity.

> Dennis

Look closer there are 85 cars in detroit alone that have lojack.
Most units are in the IOU division. 800 trunk I hear them finding
cars all the time. All the suburbs also have it. Most are installed
in undercover units. Note the 4 18" whips are no longer needed.
The ant is in the roof now. As far as 173.075 it is a good freq.

I thought it was because the cell phone system was, in a way, like the cordless system. Like the cordless base frequencies are in the 46s and the handsets in the 49s, I thought it was so for the two cellphone carriers, with the "handsets" (mobil) in the 825-834 and 835-845 ranges (rounded off) and the "base units" (cell sites) in the 870-879 and 880-890 ranges (rounded off, again). Someone who knows is due to clear this up shortly, I hope.

2776. review & call for comments on the AR3000

Newsgroup: rec.radio.scanner
Date: 1994-04-18 20:32:33 UTC
From: terminat@toicg3.to.infn.it
Message-ID: <9404181832.AA28949@toicg3.to.infn.it>
Source record: 275333

As I'm not finding reviews on my scanner, I'll post mine.
The only test paper I've found about was on a french magazine,
(Radio C.B. Magazine, 2/1992) but I found it perhaps too superficial.

My general impression, is that this is anyhow a very good apparate. It
offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing,
quite good operating commands, triple conversion, 400 memories; it is
very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected
front-end band filters reduce to some extent unavoidable intermodulation. In
general, this set offers a self contained and very well balanced compromise
of a lot of different demanding features, but will show its best when fully
interfaced.

Its price, here in Italy, has been varying greatly during the years.
Therefore I cannot say how it really competes with the choice of HF
receiver + scanner setup. It is still unclear to me how far is the AR3000
from dedicated traffic receivers, or how it compares with analogous
scanners (e.g. the Yupiteru 7100).

I'm finding a number of defects and "whish it was" that I'm going
to list (I would like to hear comments about), but perhaps I'm
just pretending too much from a receiver in which something had
to be traded off between versatility and performance. Please note
that I have a 4 years old AR3000; some defects could have been amelio-
rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack
of a variable Am bandwidth. SWL in crowded bands is too often spoiled by
the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once
sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent
signal lying some -+30 khz apart. I suspect this may be rather a problem
of AGC voltage (see below on squelch), because the feedback signal is
obtained from the previous to the last i.f. stage, which may have a larger
than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional.
On my set almost everything passes for knob positions below .3 and
only >S6 passes when I increase to .5. It may be a problem of adjustment,
but also reflect the inaccurate behaviour of the S-meter, which (I have
no measurements to support) seems not properly logarithmic. I have
the impression that weak signals give a high S readout when close to

stronger ones, because the S-meter averages on a larger bandwidth than
the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity
improves a lot when connected to an external speaker or lineout. No
noise reduction circuitry is present. External audio equalization does
a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different
demodulator (say wide band AM for satellite or TV, stereo FM decoder,
sinchro SB AM decoder). A modify could be to buffer it to a backpanel
jack.

-Intermodulation IS present. I live very close to power MW transmitter,
and in the times they're on the whole band .5 : 2.5 Mhz is unusable,
with crosstalk on every possible combination of transmitter frequencies.
At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even
with a short random wire antenna. However, I don't hear crosstalk due
to FM transmitters, which are also close to my place. The 13 front
end filters seem to do their job, since strong signals don't cause
crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In
the AR3000a it has been replaced with a (I guess optically encoded) smooth
one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod
itself seems quite easy too.
The tuning is however digital, and stepping frequency causes clicks, which
eventually trigger the squelch threshold during search. The final a.f. is
briefly muted while stepping, but I prefer the line-out signal which is
unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is
correct, because whichever choice on different antennas is entirely dependent
on the user setup, and should be rather left to an externally programmed
antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real
antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when
passing across one of the 13 band boundaries (by the way, they are 0.1-0.5,
0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335,
335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to
the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto
memory storage of catched frequencies was forgotten. Also, the oddities in
the S-metering (see above) impose manual choice when scanning non regularly
channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see //ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories. Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on the cpu board.

Carter (boothc@kenyon.edu) wrote:
[RE: Alkaline batteries...]
> How do I get the acid stabilized and hope fully removed?

Hmm... I don't know the chemistry for alkaline batteries, but doesn't the name suggest that the liquid is basic? I've just chopped an exhausted alkaline battery in half, dropped it in water, and checked the solution with pH paper. The indicator showed a pH of about 11; nicely basic (now I've got aqueous mercury waste to get rid off...$%&*&!!!)

A safe action is to rinse the crap off the unit with a lot of clean water (preferably distilled water but it's not crucial). And as someone else mentioned, remove the remaining corrosion with a rubber eraser or emery paper. If you can get your hands on pH paper you can test the neutralization process by letting a drop of water sit on the corroded area for a few seconds and then blotting the drop with the pH test paper (As a control point, be sure to also test the pH of the water with which you started).

BTW - Basic solutions wreak havoc on aluminum.

Good luck,
Tim Ikeda (timi@mendel.berkeley.edu - KE6GLW)

I recently overheard a user of a local SMR complaining that he couldn't
get air time on his "dedicated" channel. I wonder if any of the sales reps
are explaining that, in a system with 50 trunked repeaters, no more than 50
users can transmit at a time - regardless of the number of "virtual" channels
that can be assigned.

Hi Mike,
We meet again. Well, you're probably talking about the HB-232 interface that Bill Cheek is selling. There's usually an ad each month in Monitoring Times. Otherwise, Bill runs a BBS in San Diego which you can FREQ files from, or just send netmail to. His BBS is called the Hertzian Connection, if memory serves me.
Another alternative is to connect to one of your local BBSs that carry SCANRADIO (the ANARC BBS at 913-345-1978 carries it), and leave Bill Cheek a message there. He checks mail there frequently.

73, Kirk

Hi there.

A friend of mine has the above scanner. It is OK seeing he only paid
$150.

Does anyone have the Schematics for this scanner?
Does anyone have some nice modifications that he could do to it?

Thanks.

I think that a few people out here are a little unrealistic (pardon the pun) when it comes to the magazine.. first of all, ALL magazines contain adverts, in many cases more in number than RADIO. Why then do you expect R/S to GIVE the magazines out for free? Last time I checked, Monitoring Times, Pop/Comm, QST, 73, etc. all cost money to buy. And they all have adverts in them. But you don't expect them for free, do you?

Strictly speaking as a ham AND as a Radio Shack employee, I thoroughly commend this effort to interest people in the various hobbies that surround radio. Too many people are missing out on these exciting hobbies.. and who knows: with states passing anti-scanner laws, having MORE and MORE radio hobbyists can only HELP all radio arts to thrive. The price is not an issue to most people I've talked to: I've sold many a magazine these past few days to CBers, hams, and SWL's. I've even sold one or two to non-radio types.

Naturally, you're going to get the Radio Shack perspecive. You probably won't see too many Marrymac ads, nor will you see Icom or Yaesu in there. However, the information you'll find is accurate, timely, and so far, even of interest to someone like yourself.

Perhaps you might find something new in RADIO. After all, there's a lot out there from baseband to light, and I'm sure you haven't seen it all.

Comments are strictly mine, not my employer's.

In various articles, it was written:

BM> FYI General trunking assignments are made in 5 channel blocks, separated
BM> by 1MHz. So the first set might be 861.2375, 862.2375, up to 865.2375

DS> I have seen that statement made in a lot of places, but none of the
DS> SMRs that I have found in Rochester, Buffalo or Syracuse (NY) or any of
DS> the places in between (Bristol, Attica, etc) are set up that way. Nor are
DS> the ones in Niagara Falls or Toronto, Ontario.

BM> Well, that is what the Code of Federal Regulations says, but I'm sure
BM> there are exceptions. If it is a leased system, the channels could be all
BM> over the place.

Assignments near the U.S.-Canadian border are subject to their own special rules. In Region 2 (71-81 deg W, within 100 km of the border), the FCC assigns only 180 channels in the 851-866 MHz range. These are spaced at 25 kHz steps from 851.00-853.25 MHz and 863.75-866.00 MHz (on the odd 12.5 kHz points). There are 36 5-channel groups for trunks, with spacing of 18 channels in a group (i.e. Group 1 consists of channels 1-19-37-55-73). Given the first freq. in a group, the remaining four occur at 0.450 MHz intervals.

Now, ... what was the original question ?

>users can transmit at a time - regardless of the number of "virtual" channels
>that can be assigned.

When there are no repeaters available you get a beep when you key the radio,
telling you its busy. The whole trunking concept is based on the fact that
that there is a lot of dead time between conversations, where other
conversations can take place. Now if everyone was long winded, the system
would always be busy...I guess that's why Hams don't use trunked systems :-)

I'm sure that they do a study on current radio traffic patterns before they
design the trunked system. A system with heavy usage must have more repeaters
(i.e. REAL CHANNELS). So if traffic increases they need to add more
frequencies. Or talk less.

I have had one for several years and am still not sure if I like it.
It has way too many birdies and squelch level is different depending on
the band you are listening too. 100 channels is a bit much per bank
(you spent too much time locking/unlocking. On the other hand it is
MUCH better on the 800 Mhz band than either my PRO34 or BC200. I
probably would not have bought it knowing what I know now.

>Yep, you guys still have a few days to give Jonathan Clough your money
>hope that it gets here before the 26th.

At $100+ savings, with warrantee, that's not a bad option.

Buying from a source whose price hasn't floated
with the calendar...has a certain satisfaction. :-)

Other postings indicate that shipping takes 5 days from the UK.
Some of that is spent getting out of FedEx's customs clearing house,
after the package has cleared customs.

>There is a science of the allocation of scarce resources. It is called
>economics. You may find it to be an interesting source of information
>of free market dynamics.

Agreed, and if Javiation, Radio Lorenz, et al, are still
taking orders for units on hand, then there's no scarcity for another 2-3 days,
and no need for people to pay a premium.

On a separate topic:
I've heard that there is a customs form for
taking an item (e.g., 800mhz-capable radio) out of the country,
and not have customs problems when returning.
Anyone know the form #?
Any advantage to getting the form date-stamped now --
prior to the 26th?

2803. Radio Shack PRO-43 vs Bearcat BC2500XLT

Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.equipment

I am looking to buy a scanner shortly, and have narrowed the choices to the above listed models (I think the model #s are right). They have the frequency coverage I'm looking for without getting over $350 (the RS model is right at the limit). Does anyone have good or bad experiences with the two models?

Right now I'm leaning towards the Bearcat since I can get it for just over $300. However, I've been told that RS will be having a sale shortly (within next two weeks) and the PRO-43 may be put on sale.

Any comments on the two scanners (or other recommendations in the $250-$350 range) are appreciated.

Cross-posted to: rec.radio.swap,rec.radio.scanner,rec.radio.shortwave

Out of the five I brought back to the states, only one is left. These puppies went in less than 36hrs after hitting the shores. If anyone wants the last one, it is still available, is brand new in the box with all accessories and is still the bargain price of $700

I know that there is some guy in Canada that will sell for less and if you happen to be there it is a great deal, but if you want one from a non-domestic source, better do it damn soon because after the 26th, you may as well be importing cocaine or machineguns because they will be just as illegal to import.

So complain about the price but when you have the goods, and they are wanted supply and demand dictate pricing. The price is $700 and the buyer pays shipping.

After reading some of the FTP files on oak.oakland.edu in /pub/hamradio/mods/tandy, it seems that every radio shack scanner and (I suppose) most other scanners come with software capable of monitoring cellular frequencies, but a jumper or a pin allows the software to determine that these are not to be scanned. Removing the jumper must set a different logic level on the microprocessor pin that can be read by software.

Why is this done? If it is truly illegal to scan these frequencies, wouldn't it make sense for the software itself to be unable to do so? Is the easy mod put there to attract sales from people who like to delve in quazi-illegal stuff? Are these frequencies used for something else in other countries where the scanner is sold?

My cellular phone, when scanned, seems to transmit only my side of the conversation. The tower which talks to my phone, when scanned, only seems to transmit its side - thus people can't hear both sides when scanning me (hurray!) However, some other scans reveal very clearly both sides, and others reveal one side much softer than the other, but still hearable. No post has really explained this.

I don't think in all cases where you can hear both sides its because the mic on the phone is picking up the earpiece, because the scans I refer to come from the tower, not the phone.

Yes, but I would think most people scan by listening to the tower, not
the phone itself. Sometimes the tower echos, and sometimes it doesn't.

Shawn,
I guess you have never heard of satellites and other things that use
the 800mhz band. Some satellites when downconverted put the resultant
frequencies in the 800-900mhz band, in fact some sats down convert to a
range of about DC to 2000 mhz. Just because it is not an over the air
use don't for one minute suspect the the cellular frequencies only
belong in some FCC bueracrats mind to cellular. It just is not so.

I use my scanner on the output of a dish down converted to 700-1500
mhz to listen to some radio stations and other legit services.

I guess the feeling is that if you ban radios that tune a frequency
the frequency is now secure. Big joke huh? Buy some nickel-dime
parts and you have a mixer. Listen to the mixer output and the
banned frequencies are back. Gonna ban the parts to?

These stupid scanner laws are the result of feel good liberals.
We passed a law so it is now fixed. If you want security, then
build a secure system. But I guess that is too hard.

The real dupes are the public which beleives the feel good types,
and actually think the cell phones are secure.

Now that we have explained the assignment criteria, how are people supposed
to listen to all of this?

To the kind poster from Motorola: NJSP uses your system, how can scanner
listeners monitor a single subgroup? Are the subgroups constantly updated on
the control channel? I was actually hoping that a different PL is encoded
into each transmission based on the subgroup. There are well enough PL's
to cover a large number of independent subgroups, right? Has that ever been
tried? I guess since the computer has to determine what output frequency
is available at the time, it might as well tell each radio to change to the
appropriate frequency at the appropriate moment.

Oh well.

I'm not sure, but it seems like a possible loophole might be to use an
AC-ONLY scanner in your vehicle, powering it via an AC portable power
inverter (Radio Shack # 22-132). Although the car's DC battery is the
original source of the power, the scanner itself still operates on
alternating current. Bet that would make an interesting test case! ;)

But, my guess is, the bill is worded in such a manner as to preclude this
possiblity. : (

2815. ILLINOIS scan ban, ACT NOW

Newsgroup: rec.radio.scanner

Source record: 275373

This is a cross posting from CIS and requires immediate attention.

FLASH - IMPORTANT - ACT NOW

HOUSE BILL 4180 - 88TH GENERAL ASSEMBLY STATE OF ILLINOIS 1993 AND 1994

INTRODUCED BY REPRESENTATIVE CROSS ON 12 APRIL 1994

SYNOPSIS AS INTRODUCED 720 ILCS 5/31-9 NEW

LRB8814416RCMB Sec.31-9

Amends the Crminal code of 1961. Prohibits the possession of a receiver or transceiver capable of monitoring or broadcasting police, fire, or other municipal radio frequencies unless the device operates exclusively on alternating current power. Penalty is a Class B misdemeanor. Exempts peace officers, fire officials, municipal employees, agents acting in an official capacity, and the press.

THIS IS OUTLANDISH! Write to the members of the Illinois

Leigslature, and the Governor. Especially this fellow Cross. This is clearly in violation of the FCC directive on laws restricting the possession of amateur radio equipment. Your PRO-2006 and most other Base radios can be powered by 12VDC, and thus would be made illegal under this propsal. Pass this message onto other BBS systems. Notify every amateur radio operator you know, and the ARRL. Get ready to write a lot of letters. I will post a complete address list for the Illinois House of Reps in the next few days. Note that the press are exempt. Act now or dont complain when they arrest you for listening to the radio. This is not a joke. This is real. Its time once again to defend our rights, what are you going to do? - Ted / Chicago Area Radio Monitoring Association.

I'm not usually hyperparanoid (merely average-style paranoid), but
Tripp Lite in Chicago would be happy with this since they make a
line of power inverters (generating a 110VAC square wave from 12VDC).

Probably far-fetched....

2819. Re: What to do when Batteries Leak.

Newsgroup: rec.radio.scanner
Date: 1994-04-19 22:15:34 UTC
From: boothc@kenyon.edu
Message-ID: <1994Apr19.171534.10715@kcvax1>
Source record: 275277

I originally posted that my girlfriend much to my chagrin plugged my pro-43's power source in to the charging jack. Only one problem, it didn't have my recharables in it. As a result the Duracell's leaked (not Energizer's like I originally posted - too frustrated). Fortunately the Pro 43 was in an upright position and the leakage did not go "up" into the circuits too far. After posting I called a Chemistry Professor who suggested exactly what Hugh Wells and a few others did. All is well now, but the Warranty is obviously null and void 'cause all the white imprinted battery directions came off....guess it's an open invitation to start doing all the other mods besides the 800.

I guess the most important differentiation to make is whether your batteries were "base" or "acidic." I'm not a chem person, nor profess to be even remotely clued in, however as we all do it, I will infer a few things.

Please Correct me if I am wrong.

1. If batteries are Alkalines - use vinegar.
2. If batteries are non alkalines - use ammonia.
3. An excellent way to "clean" the circuits is with ethanol after the Procedure.
4. Most damage will transpire before you notice the problem, and in reality your "neutralizing" is infact just cleaning up the mess already made.
5. Cover up the "charging" jack if using nonrechargeables in your scanner with a power cord. A piece of electrical tape works just fine -- or just keep your rechargables in all the time. I will.
6. Keep your scanner "upright," even if attached to and external antenna. If *any* problems occur with batteries the mess will either drift down, or harm they keyboard area, probably less expensive to repair.
7. Check your batteries frequently. You will feel as foolish as I did having your expen$ive scanner ruined by a $5-8 set of batteries.
8. If you have problems determing which type of battery you have, just drip some of the leakage onto any "avaiable surface" and try each of the two chemicals. I believe the proper one will react.
9. Q-tips worked well for the procedure.
10. Use a well lit area if opening the scanner.
Ground yourself -- no static
Don't lose small screws.
Write down exactly in order what you remove, so you can replace it.
11. If you don't understand what this all means don't do it. IT WILL VOID YOUR WARRANTY UNLESS YOU CAN PROVE THAT THE UNIT IS AT FAULT.

enough babbling..

Thank You to all who responded. You were of great help.

Carter

Here is a couple of key addresses to voice your opposition to Illinois House Bill 4180, the proposed banning of DC powered scanning equipment. Tom Cross is the Representative proposing this bill.

Illinois Rep. Tom Cross
541 Countryside Shopping Center
Yorkville, IL 60560

2138 -O Stratton Building
Springfield, IL 62706

Illinois Govonor Jim Edgar
State Capitol
Springfield, IL 62706

Representatives for your district may be found by calling your local public library.

* * NON-RESIDENTS OF ILLINOIS...Your input is just as important. If this law is passed, this may give YOUR representatives to propose laws similiar to this in your state. Please send your letters to the above two individuals.

Jerry

Of course all of my observations are hypothetical (since I would _never_ do anything illegal), but I've noticed that most of the time when the cell call is one-sided on my scanner, the side on the cell phone is the one that can't be heard. I've also noticed that once in a while the side that is unhearable slowly fades in until I can hear it. I always attributed this to the phone being too far away to hear but the tower to which it is communicating being close enough.

I dunno, 'cause this brings up some problems as well. But that's how I figured it before I started reading this thread.

Later!

>: quazi-illegal stuff?

Remember the mods described are for scanners that
were designed before the current ban on scanners
with cellular coverage was passed. Thus, those scanners
originally covered the 800mhz band, but the individual
manufacturers often altered the software to exclude
cellular to give the appearance of the unit excluding
cellular. Subsequently, since the cellular exclusion
so implimented, was little more than a software patch,
it took little effort for people to discover how to
"unpatch" the exclusion of the cellular.

As to the new scanners on the market which are "supposed"
to be not easily modifiable by law, only time will
tell how well manufacturers have designed their
units to, in fact, not be field modifiable to
regain cellular coverage.

>I guess the feeling is that if you ban radios that tune a frequency

>
>The real dupes are the public which beleives the feel good types,
>and actually think the cell phones are secure.

Amen to that. If, the new crop of scanners does prove to be
unmodifiable, then you'll see a bunch of tech articles on
how to build a broadband downverter. As pointed out above, the parts
to build such a unit are not of any special electrical
design that they could be readily banned from sale. It should
be interesting to see how things go as the once the stock of
cellular cabable scanners disappears from store stocks.

If your cell system's "base" carrys both sides of some cell calls and only one side of others chances are one of the parties in the "one-sided" calls is outside the local calling area. Not all cell systems handle outside calls this way but I've seen/heard some that do.

Sam,
I doubt you are going to be entirely satisifed with an ICOM R1 as
a replacement for your BC 200. I own an R! and love it, but have to
acknowledge it's manifold shortcomings. In high RF enviornments it has
images all over the 460.xxx MHZ band in which most UHF police
transmissions are assigned. It is almost stome deaf on MW and HF
(shortwave). Only the strongest signals will get through on those bands.
It has images and intermod problems (see above) that will drive you buggy
at times.
HAving said all that, I wouldn't aprt with mine for the world.
I've done a side by side with a Yupi MVT-7100 and acknowledge a
noticeable edges for the Yupi, though not enough of one to convince me
that "trading up" is worthwhile. The size is neat and it does a nice job
on military A/C. There is something "cute" or neat about it and I really
enjoy it... but I CANNOT recommend it to anyone as their sole or primary
scanner. It may perforem adequately in low RF (rural) enviornments, but
it ahs some limitations and operational quirks that migh frustrate many
users.

I am the owner of a cobra SR-15 scanner. I am sure that the scanner was made for cobra by one of the major scanner manufactures. I am interested in finding the potential modifications of this radio but have found none for this model. If you have any idea of other names that this radio was marketed under, I would be able to search for modifications for the other names. So if you could help me by supplying me with potential modifications or perhaps other names that the Cobra SR-15 radio was sold under, I would be grateful. Thanx

ATTENTION!!!!

Note the impact of this proposed law is far beyond any existing
"scanner" law found in other states. This proposed law makes
POSSESSION ANYWHERE a crime. If this law is passed, everyone
in Illinois that currently owns a DC powered scanner will be
technically required to dispose of them or be in violation of
the law. Likewise, anyone driving through or otherwise visiting
the state of Illinois and has in his/her possession a DC
powered scanner will be in violation of the law.

Under this proposed law, if you have a mobile scanner or a portable
in the trunk of your car, in your home, etc. you are violating
the law.

As to the exemptions, isn't it nice to know that as citizens, you are
afforded less rights than members of the press.

If the state of Illinois passes this law, watch for it to be
emulated in other states.

Standard Disclaimer- Any opinions, etc. are mine and NOT my employer's.

Bill,

Can you provide us with the liberal/conservative count for the voting
on the ECPA or are you just blowing hot air? I always thought that is was
the result of "law and order" conservatives. Be careful not to shoot
yourself (and your argument, and all of us who also hate the monitoring laws)
in the foot.

I'm not saying that you're wrong. I honestly don't know. But I listen for
truth, not hot air.

Regards,
Neil

You know, I think it would behoove us if someone in a position
to do so would start investigating the creeps that keep trying to
submit this sort of garbage legislation around the country. I
strongly have my doubts that it is JUST some alleged public
safety concerns that are driving these things. If I'm right about
that, we need to find out WHAT the driving force is.....

>onto other BBS systems. Notify every amateur radio operator you know, and the

PTTTHHPPPTTT!!!! ARRL? Hell, they can't even protect Amateur
Radio anymore, let alone deal with scanners. Forget the ARRL and
go to individual hams - you'll get more done.

I'll have to keep watch over here in Indiana - since our
state congresscritters are copycats and apparently can't think of
anything on their own. :-)

2843. Aftermarket antennas for PRO-43?

Newsgroup: rec.radio.scanner
Date: 1994-04-20 18:44:14 UTC
From: jswan@elaine53.Stanford.EDU
Message-ID: <JSWAN.94Apr20114414@elaine53.Stanford.EDU>
Source record: 275300

Are there any antennas for the PRO-43 that will work better than the coil-loaded telescoping whip that RS sells?

I'm interested primarily in ~155 and ~460 MHZ emergency bands, as well as in 2m hams.

BTW I'm quite new to scanning and like the PRO-43 a lot, except for the incredibly annoying lack of lockout on search. It is also a battery pig--I seem to get only about 4 hours out of 6 fully charged nicads.

Also, how does it function with a mobile antenna? Any problems?

Source record: 275302

I could not find this in the manual and I had no luck trying it on my own.
I have seven trunked channels in bank 1 in programmed scan mode (P-SCAN).
Several of these channels switch between voice and MDT use. When used by
the MDT I want to lock it out. Is it possible to lock out any of these
channels while in the P-SCAN MODE ? I tried the function + skip keys but
it does not work in P-SCAN. I could take this channel out of P-SCAN
then lock it out, but that seems like the hard way to do it.

Any Ideas ?

Thanks in advance

Although Radio Shack didn't have a manual in the store, they can still order one through what is called consumer mail. it is an internal warehouse that they have, that carries items like old manuals. the manual you receive, might just be a photocopy of an orginal, but you would still have one.

Richard Crisp posts:

>I know that there is some guy in Canada that will sell for less and if you
>happen to be there it is a great deal, but if you want one from a
>non-domestic source, better do it damn soon because after the 26th,
>you may as well be importing cocaine or machineguns because they will be
>just as illegal to import.

-a good example of a run on sentence...

That Guy in Canada is:

Radio Lorenz
482 Ste. Catherine St. West
Montreal, Quebec H3B 1A6
ph: (514) 392-9200
fax: (514) 392-4767

MVT-7100 for $570 US with shipping, handling and customs fee.

Example:
I sent a money order FEDEX Tuesday, he`s shipping Wednesday for arrival via
UPS expedited on Friday. With warranty and and after sales service that`s
not too bad. (I called him 10 minutes after he received my FEDEX and he
was already packing it for UPS to pickup)

RE legalities:

So what if it`s against the law... Why let a little thing like that stop
you? I have no problem breaking laws, it's getting caught I`m worred
about. I speed, jaywalk, yes and have even used my mobile scanner in
New Jersey (is it still illegal?). Furthermore I`ve torn the tag off of
a mattress before (a hanging offence in some states). Just because it`s
the law doesn't mean its a good idea (except for profiteers) or justified.

Busted importing a scanner, hate to have that on my record. Better some-
thing respectable like a SEC violation, insider trading or lying to Congress.
>So complain about the price but when you have the goods, and they are wanted
>supply and demand dictate pricing. The price is $700 and the buyer pays
>shipping.

What was your cost? Do I get a warranty, after sales services, after
sales accessories - in stock? Next year?

I`d consider this price gouging myself. Some people sell water in a
drought for $10 a gallon or plywood before a hurricane for 5-10x it's
cost. That`s the dark side of capitalism, greed.

Enjoy your money.

2849. CTR-76 VOX recorder "hang time" mod

Newsgroup: rec.radio.scanner
Date: 1994-04-20 20:51:54 UTC
From: copeland@metronet.com
Message-ID: <CoKsMJ.5yI@metronet.com>
Source record: 275306
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

Radio Shack has the CTR-76 on sale for $35 (regular $50) and here is
a conversation I've had about mods for it:

>>Unfortunately the "hang time" of the voice activator is 5-12 seconds.
>>This is to long, wastes tape between police call transmissions.
>>DOES ANYONE HAVE A MOD FOR THIS YET?

>I was looking inside the CTR-76 and found that capacitor C23 was part
>of the RC circuit for the hang time. I put a 12K ohm resistor in
>parallel with C23 and now I have a very short hang time (maybe too
>short depending on your needs, less than one second).

Your suggestion works great. I tried a 50K resistor across C23 and
the hand time is just right (2 to 3 seconds).

I also noticed that there is a pot maked "speed" on the circuit board.
I haven't tried it, but I'm sure you could slow it down to get more
tape time (record time vs. recording quality). Probably slowing a
45 minute tape to 60 minutes would show no degradation of audio
quality.

2850. Anyone ever used counters?

Newsgroup: rec.radio.scanner

Sorry about that - couldn't resist that subject line.

I've heard that there are two cases for the 7100, a plastic
one and a leather one. Any opinions on which to go with?
The price seems similar. And I don't want to go around
using a $600 radio naked (oops, that doesn't sound
right either...)

Please drop me a note or post here.

THANKS

2857. Re: Why is cellular sometimes one-sided?

Newsgroup: rec.radio.scanner
Date: 1994-04-21 02:27:00 UTC
From: dseitel@crl.com
Message-ID: <2p4o9k$r5o@crl.crl.com>
Source record: 275314

In alt.radio.scanner in the "Cellular" thread, in which the poster asks for the cellular freqs, the last two sentences of the response are:

" Mobiles transmit 45 MHz below the base (824.040-848.970) and are usually repeated by the base. Channels are .030 MHz apart."

I am wondering, of course, if the first sentence might relate to this discussion?

^^^^^^^^^

Since that would appear to restrict the ownership of ham radio rigs with wideband receive capability it appears to put the proposed law squarely in conflict with the FCC regulatory powers over transmitters. Plus of course a lot of current ham rigs run ONLY on DC - to run them in the house you have to have an AC to DC power supply (like my ICOM 735).

If it passes in this form it will undoubtedly be taken to federal court as a jusridictional conflict between the state and the feds. Sure would be nice to avoid the legal fees to the nation (via the FCC) and to the people of Ill (both the feds and the state) to fight that out...

One could use an inverter (to generate a 110 VAC square wave from 12 VDC) to power an AC scanner in the car. Tripp Lite, based in Chicago, makes inverters. Hmm...maybe they know someone in the Illinois legislature...c'mon now...

For those of you who are interested, here's some info I got with gopher/ftp:
I know this is from January 1993, but if anyone can update/inform as to a
newer list on the internet, that would be good. (Especially because the
seemingly infamous Representative Cross doesn't seem to appear on this
list).

>Internet service.)

I think we are getting a little too worked up here. Richard has been on the net for a lot of years, and he is not the bad guy people are making him out to be.

Since the National Science Foundation gave up control of their portion of the internet, the are no "rules" on what can be done over the internet. The only rules now are "netiquete". I'm sure Richard knows all about that already.

Richard was just using supply and demand. If his price is too high then no one would buy them, he would then lower the price until they were sold. I personally think he was jumping the gun a little, but if he got his asking price for the scanners, then obviously the demand was high enough to justify the price. (although the sales pitch was a bit strong for the net)

What people seem to be worked up over, is that he is profiteering over Usenet, but I don't think that's the real issue. If Richard were go to Japan and buy the Yupi for $400, bring them back to the U.S. and sell them for $450, you can bet no one would complain. They would welcome such a deal. He is still making a profit, but providing a serivce by selling the scanners below what the average Joe could get them for. My point is, what he is doing is no different. If people dish out their cash, then that is an indication that it IS a good deal - even at $700, otherwise they wouldn't buy it.

The real issue is whether the people who purchased from Richard knew that the scanner is still available from other sources at a "cheaper" price. Here on the net, people are always trying to help people find the best deal. So if someone is selling the scanner at a higher price we feel it is our duty to warn everyone. I guess that is what is happening here, but the warnings should be directed at the buyers, NOT at Richard. The price of the Yupi has been posted he MANY times in the past (as well as the April 26 deadline), so if folks are still willing to pay $700, they either don't READ the messages here OR they feel that $700 is worth it. Flaming Richard isn't going to

change either of these.

I owned one for about a year and then sold it. My personal opinion is that if you are not the type to drive around for the specific purpose of determining a frequency, then you will never use it. Just having it with you, is not going to provide much useful info. For finding new frequencies, you have to be fairly close to the transmitter.

The plastic case protects the keyboard from dust and numeral wear, and the
display from scratches. But it's soft vinyl and will wear too; also it
makes the display even more difficult to read.

The leather case is thick and tough, but does nothing to protect the
display or keypad.

Take your choice. I find myself using the vinyl one the most.

Here's another cross posting from CIS. It includes the phone number of
the rep that proposed the bill TOM CROSS. I am urging anyone who wants to
keep their scannner in Illinois to call his office as well as your local rep.
and voice your opinion. Boy wouldn't it be nice to get a INTERNET ADDRESS
for these people. If I find more address and phone numbers I will post them
at a later time.

Larry

Illinois House Bill 4180, which makes illegal the possession of any
scanner that can be DC power operated, was sent to committee on 14
April, 94. It wil be discussed before committee on 21 April, 94, Room
D1, at the Straton Building, In Springfield, Illinois. The general
public will be allowed to testify before the committee at that time.
You will need to arrive early and obtain a witness slip if you plan
to testify.

This Bill was proposed by Rep. Tom Cross, from Yorkville, Illinois.
His Yorkville office number is (708) 553-0000. His Springfield Office
number is (217) 782-1331. The current status of the bill may be
checked by calling the clerks office in Springfield - (217) 782-7192.

More information will be posted here soon. We urge you to appear in
Springfield Thursday morning for a real show of force. In the
meantime, why not contact Rep. Cross at his office and let him know
how you feel. Write a letter to your Illinois House representative
and the Governor. Stand up and be counted, fight for your rights or
lose them forever! - Ted / Chicago Area Radio Monitoring Association.

> Bob Wier, East Texas State U., Commerce, Texas

But the jurisdictional question/issue would ONLY be as to the effect
of the law on licensed amateur radio operators (hams). If that happened,
it wouldn't invalidate the law, it would merely eliminate the law's
impact on hams. Personally, I detest these laws and as both a ham
and scanner enthusiast worked towards changing the old New Jersey
law to one that allows scanners anywhere. The law was changed for
the benefit of both hams and non-hams. Hopfully, the same approach
will be taken by the combined efforts of hams and non-hams to fight
this proposed law in IL.

Having said that, remember that all the IL legislature needs to do
to avoid conflicting with federal jurisdiction relative to hams
would be to add "amatuer radio operators" to the list of
exempted people. Also,, even if the law passes in its current
form (without a ham exemption), don't expect the FCC to go to bat
against the state on a jurisdictional issue. That, unfortunately,
will only happen when a ham is charged for violating the law
AND it will be the burden of the ham to prove to the IL courts that
hams should not be charged under the statute by basis of federal
pre-emptive rights.

Also, I cross-posted the notice about the proposed new law to
the "autos" newsgroups as I agree with another poster that suggested
that the law (at least according to the synopsis) could be
interpreted to ban radar detectors also.

Standard Disclaimer- Any opinions, etc. are mine and NOT my employer's.

I'm getting pretty much the same deal. He told me that the import
restriction only applies to dealers and that he is not restricted
selling it to me as an individual. Of course, he could be wrong
but either way, I'm getting it before the deadline.

>cost. That`s the dark side of capitalism, greed.

Comparing price gouging in times of a natural disaster where people's lives and property are at risk to rising prices of some hobby equipment when supplies are disrupted is blatantly irresponsible. I would say a far fairer comparison would be to the price rises of things like AK47 and AR15 rifles after the government arbitrarily decided they would stop importation of the former and severly restrict manufacture and sale of the latter.

We all know what you mean, but your gripe is misdirected. You should vent your ire at your elected congressional delegation, not someone that is simply trying to make a buck. I noticed that when Saddam invaded the Kuwait that oil prices rose sharply overnight. There is a simple explanation for this: when supplies are disrupted prices rise.

Greed, like it or not, is what motivates all in business. Many will not admit it, but the fact is they are all in it for a profit. I have no problem with it at all. Many feel that profit is immoral.

For an example of how well systems work when the profit motive is removed have a look at the formerly Communist countries. They abhorred profit, felt all should have in accordance with their needs, and today you can't even buy a week's worth of food with a month's wages.

You would do well in the Democratic People's Republic of Korea, perhaps the last bastion of communism. The guy to contact is Kim Il-Sung.

By the way it is possible to hear him on my Yupiteru, just tune 6576 or 9977 at 1100utc!

Here is the exact wording for the illinois scan ban proposal.
Larry

Illionis House Bill 4180 Amends the Criminal Code of 1961. Prohibits the possession of a receiver or Transceiver capable of monitoring or broadcasting police, fire, or other municipal frequency operates exclusively on alternating current power. Penalty is a Class B misdemeanor. Exempts peace officers, fire officials, municipal employees, agents acting in an official capacity, and the press.

the wording is as follows:

HB4180

AN ACT to amend the criminal code of 1961 by adding Section 31-9.

Be it enacted by the People of the State of Illinois, represented in the General Assembly:

Section 5. The Criminal Code of 1961 ia amended by adding Section 31-9 as follows:

(720 ILCS 5/31-9 new)

Sec. 31-9. Poertable scanners.

(a) A person, other than a peace officer, fire offical, other municipal employee, agent acting in a officail capacity, or member of the press, shall not possess a receiver or transceiver capable of monitoring or broadcasting police, fire, or other municipal radio frequencies unless the device operates exclusively on alternating current power.

(b) Violation of subsection (a) of theis Section is a Class B misdemeanor.

Who's loss will it be if it is siezed by customs (assuming you have it mailed or shipped to you)? If it is the loss of the seller, then it seems fine to take the risk. If the risk is yours, understand that you may be out $570+ dollars and have nothing to show for it but elevated blood pressure. If I understood the details of your transaction, then you sent the money in advance. It would appear that stated or not, you are assuming the risk.

>What was your cost? Do I get a warranty, after sales services, after

Barry, in all fairness, do you ask this question regarding cost (hence profit) to the merchants you shop with? I dare say not. Why is it OK for your landlord or grocer to make a profit on goods and services they provide to you and it is not OK for me to? Is it Ok to make profits on necessities and not on hobby equipment?

>military and ham on SSB, etc. I'd say the issue here is HT vs base/mobile.
>For an HT, there is nothing I've heard of that comes close to the 7100

Matthew is right. I regularily use my *used* MVT7100 for monitoring HF
military traffic while driving around in my car. I open the sunroof and
poke the antenna out. Good old 11176 comes in great (USB, of course),
and I have even logged Air Force 1 twice on 6812USB. It is true that
the tuning is a bit off and is noticable on SSB, but it is only
a minor irritation and it is very easy to tweak considering the 50hz steps
.

Someone complained that 50hz steps ae too coarse for effective SSB use.
They are half as coarse as is found on a Sony 2010 or a SonySW55. Both
of these radios enjoy a fine reputation in this and other news groups.
I personally find 50hz fine, but greatly prefer the 1Hz tuning I have
on my WJ HF1000 or the three Racals I recently sold to get the WJ. With
those puppies you can nail the thing right on!

I have bought and used all of the popular handheld scanners, and find
nothing compares with the Yupi 7100. Because I am such a big fan of it
and because I like to buy new radio gear, I have attempted to provide
a service to the radio community by extolling the virtues of the 7100,
and even bring a few of them in for the benefit of the lucky few that
have been able to get them. No one that has bought one from me has
ever complained about it, and I typically get email from very satisfied
owners after they got them.

If you can find one, get it!

While I am not a lawyer, I believe it is just as illegal to monitor INMARSAT
as it is to monitor cellular. Reading the penalties in the ECPA, it appears
the penalties for monitoring cellular are *reduced* in comparison to the
penalties for monitoring other services where you are not the intended
recipient. It may be worth reading Title 18USC section 2511 if you
would like the straight scoop.

Ok, I will.

Richard,
The last time I remember you selling these, you had one new one
for..$575 as I recall. Now you have a batch of five you are (have
been) selling. Hmmm... As I recall you can only bring three non FCC
approved radio devices into the country for PERSONAL use at one time.

Here's an address for you-
424 Customhouse
555 BNattery Street
San Francisco, CA 94111

It's your local FCC office. Go there and turn yourself in.

[stuff about mods to scanners edited]

: Why is this done? If it is truly illegal to scan these frequencies,
: wouldn't it make sense for the software itself to be unable to do so? Is

[more stuff edited]

Here's my take on this (and someone will bludgeon me if I'm wrong)...

The ``clip a diode here, put a jumper there stuff'' is the result of the fact that the United States isn't the only place in the world and that the scanners are often sold all over the world. The manufacturers generally invented ways that *they* could easily modify the scanner to adhere to the local laws of whatever countries they were trying to market (or, indeed, import) their scanner in(to).

The easyness of the mods is only going away because US law specifically, as of April 26, requires that they make the units unmodifiable (whatever that means). It seems as if elsewhere the burden to obey the law is somewhat more on the user of the device than on the manufacturer.

> That's a good question. Maybe if we knew WHY he introduced
>this law we could fight it better!

Odds are the bill is the result of:
1- A request by the State Police and/or one or more of the various
police associations that exist in the state,
2- The legislator's reaction to hearing about a crime that was
committed where the criminals were using a scanner, or
3- Both 1 and 2 above.

Unfortunately police organizations tend to have the ear and
leverage with at least several legislators in any governing
body. Often pthe police want everything their way with no
regard what-so-ever to individual rights, freedoms, etc.

Sorry if this sounds extreme, but if you were around when CB radio
first became the rage, the police would have loved to have them banned
too.

>Arn't the celluar service providers switching to digital signals and
>therefore making the celluar transmittions unlistenable via scanners
>anyway?

yes this is what is now happening. It will take some time before the
analog gear is phased out, but it does serve to underscore the silliness
of the new law.

The new law banning cellular capable scanners is very similar to what
happened with certain firearms in 1986. First machineguns were
required to be registered in 1934. In 1986 manufacture of machine
guns for sale to civilians was made illegal with previously registered
ones remaining legal and salable. Now in 1994, the whole combined
force of the media, the lawmakers and various special interest groups
have joined forces to eliminate all gun ownership.

In 1934 the first laws were put on the books at the Federal level
to protect radio and wire communications. In 1986 (see the pattern?)
the ECPA was passed with a large amount of lobbying by the cellular
telephone industry association. In 1992, we got the scanner ban
jammed down our throats. Now we are reading of legislation in Illinois
making it illegal to *possess* a battery powered scanner.

The path the gun banners are taking is precisely the same as the one
being taken by the scanner banners (kinda of catchy name, Scanner Banner).
It is important to recognize that the government is out to destroy our
hobby despite the fact that the overwhelming majority of scanner listeners
are doing so for their own personal enjoyment and are presenting a threat
to no one.

I get really disgusted with the notion that the government is here to
help and protect us and is doing so by encroaching my liberties on a
daily basis. I have never considered myself anything like a radical,
but to listen to the rhetoric be spouted by the congresscritters one
would think that anyone that likes to shoot or listen to radios, is
some kind of leftist terrorist or some wild eyed kook. I for one
really resent this.

I'd be interested in other opinions others may have on this.

William Glover wrote:
: ...These stupid scanner laws are the result of feel good liberals....

I sure don't know how the vote tally breaks down, but would be surprised to find it a "liberal" effort. "Conservatives" seem much better at getting the government off the backs of business than off the backs of individuals--ironic, to me. These words are slippery as descriptive terms. In medicine, it is "conservative" to rip open a guy's chest and strap in some leg veins, "radical" to tell him to diet, exercise and cut down fats. Also, "liberal" has become a loaded word, further reducing its value as a descriptive term. It works fine for demonizing the opposition, though.

I know it sounds here like I *am* a liberal, but I'm really neither. I just have a problem with these labels.

I'm interested in starting a FireNet notification network
here in the Phila. area. I currently have an alphanumeric
pager from SkyTel. If anyone else who is on that system is
interested (anywhere in their coverage area across the US),
please reply.

To keep message costs to a minimum, message size would be limited
to 80 characters. If there's enough interest, notification of
other major incidents could be included.

I will summarize to those who respond.

Thanks,

Bob Esposito

I have to jump in here and say that I've exchanged mail with Richard a number of times and he seems like a reasonable guy. I think people are over-reacting here. In fact I had queried him a few times on doing a purchase myself, but always seemed to hit a period where he didn't have one. In the meantime, I had a friend go to London to a conference and so had them bring one back for me.

If he feels like the going market should be a certain price, so be it. It doesn't put him in the same light as the lawyers or Jesus freaks who post to 3,500 newsgroups simultaneously, or the guys with the Dave Rhodes pyramid schemes...

I know that Matthew Rappaport has tried both cases (he is another satisfied customer of mine, btw), and has opinions regarding the relative merits of the two cases. But whatever case you get GET A CASE to preserve the little cute numbers from wearing off the keys. They are sometimes hard to find as the Yupi's are such a cult item, but they are worth the look.

2895. HAM repeater frequencies (potential FAQ)

Newsgroup: rec.radio.scanner
Date: 1994-04-21 20:05:08 UTC
From: P.J.Hinton@nd.edu
Message-ID: <2p6m9k$99j@news.nd.edu>
Source record: 275202

I'm fairly new to scanning (less than four months), so please forgive me
if this is an FAQ.

In <<Police Call>>, there is a listing of frequencies and their allocations
(e.g., cordless telephones, public safety, railroads, etc.). I noticed that
there are several bands which are designated for HAM radio, and I am interested
in listening to frequencies being used in my area. The problem is that I have
no SEARCH option on my scanner, and there's no one I know personally who could
answer this question. Could someone out there direct me to a useful reference
listing HAM repeaters or even perhaps provide some of the frequecies used in
the area near South Bend and Mishawaka? Thanks in advance.

x
I just spoke with Rep. Tom Cross, my Illinois (Republi-
can) congressman who introduced IL House Bill 4180,
essentially outlawing portable and mobile scanners and
transceivers with extended frequency coverage.

He has shelved the bill temporarily and will reintro-
duce a much different version later. The new version
will make it a crime to *use* a radio receiver like a
scanner in the commission of a crime.

Cross said he was originally prompted by police groups
who are frustrated by gang members and criminals using
scanners. Now, that he has heard from several people
protesting 4180, he realizes the side effect of outlaw-
ing scanners and regrets that the original bill was
drafted so poorly.

Cross asked me how I heard about the bill and I told
him "a computer network at Bell Labs." I told him I
would let people know the results of our conversation.

Sorry for the bandwidth guys, but this is an interesting topic, and we need to fix this problem.

Lee, I get your mail but tosspost.sv.com does not exist! Whois can't find you. Lookup can't see you. Are you a Slip connection? in which case you can't get mail without inconveniencing everyone, so don't even try. We have a lot of users here (via slip) who send mail, and then wonder why replys bounce. You have to be connected all the time to get mail directly. Try finding someone to host your mail, and direct it there.

The other possibility is that your MX record has a typo (srv for sv perhaps). Only your sysadmin can know for sure.

Good luck. Try mailing yourself with a full domain spec to see if your DNS is working correctly.

Bob, isn't it already illegal to do this? Like against an FCC rule?

So it would be redundant.

And my hunch is it would also still ban radar detectors (used in commission of the "crime" of speeding).

> Cross said he was originally prompted by police groups

[list of US congresscritters from Illinois]

Great list for future reference, espeically for people to contact and try
and get the stpuid and idiot recent US scanner law repealed.

However, as far as the Illinois law goes, it would be more useful,
I should think, to post a list of *ILLINOIS STATE* legislators, not
US Senators And US Representatives.

In spite of that, my compliments on posting a useful list.

Duane

: >: >is a Class B misdemeanor. Exempts peace officers, fire officials,
: >: >municipal employees, agents acting in an official capacity, and
: >: >the press.

: ATTENTION!!!!

: Note the impact of this proposed law is far beyond any existing
: "scanner" law found in other states. This proposed law makes
: POSSESSION ANYWHERE a crime. If this law is passed, everyone
: in Illinois that currently owns a DC powered scanner will be
: technically required to dispose of them or be in violation of
: the law. Likewise, anyone driving through or otherwise visiting
: the state of Illinois and has in his/her possession a DC
: powered scanner will be in violation of the law.

"Far beyond" is right! Like most shortwave radios, which can recieve
plenty of HF municipal frequencies. You've got a 2010 or YB-400?
Sell it, or face criminal prosecution! (Those BBC World Service
Hoodlums - fifth columnists, don'tcha know!)

Or most TV sound receivers. (Don't try to tune below channel 7!)

Or those "5-band" jobs, sitting in most people's attics, that show up
at garage sales. My mother still uses hers. She listens to gardening
shows. I guess Illinois would disbar her. My father used to get a
weather report on one (smack in the middle of you-know-which forbidden
band!) before sailing.

Your grandmother might be a criminal and not even know it.

And isn't *any* transciever capable of broadcasting? A tot's walkie-talkie can relay police transmissions from a "legal" scanner. Not to mention CBs, business band, GMRS, amateur, taxicab, you name it. All "capable," right? Even, I guess, private ambulance mobile rigs. Maybe cordless phones? Cellular? *All* outlawed?

Are airports "municipal"? Criminal pilots - no exemptions for them! How about the Natick Neighborhood Bus? That's how it's listed. Real security risk, there.

Geez! Even the President on Air Force One doesn't scramble *every* call!

When radios are outlawed, only outlaws will have radios. Especially since that's going to be everybody. Civil disobedience seems really quite unavoidable. Very civil - none more so, since the "criminals" won't even be doing anything.

In an age in which governments seem incapable of enforcing law, why create millions more criminals in a necessarily ineffective bid to do what could be done effectively through other means? Secure transmissions are easily purchased. Hell, AT&T has a digital 900 MHz phone out, on sale at Sears. Surely the sovereign state of Illinois can apply the technology to their needs. Are rights really of so little value to legislators?

Consitutional issues abound. Like, overly broad? Unconstitutionally vague? Federal jurisdiction only?

Wedged idea of the decade.

End soapbox. Out with the stationery.

-drt

It probably is the typical knee jerk reaction so popular these days among the "big government" fans: someone uses a gun or a radio to help them commit a crime: therefore by eliminating guns and radios it will be harder next time for the same modus operandi to be used.

This fails to acknowledge the fact that very few of the scanners and guns in the hands of the public are ever used in the commission of a crime. This doesn't bother the "big government" people, all they want to do is fix one problem and simply have their blinders on for the problems they create.

Lots of crummy laws are created by well intentioned people. The problem is that only a dolt is capable of being elected these days, because if you have ever done anything of significance, someone will have a way of making it appear that you are corrupt, immoral or greedy.

When you elect dolts, expect this sort of crap. The solution is to toss the bums out of office. Unfortunately we radio folks have the reputation created by the media riding the coattails of the dolts, of being a bunch of voyeuristic perverts that like to eavesdrop on private and personal conversations and that no one should be allowed to do that. So as a result it is easy to convince John and Jane Knuckledragger that this is a good thing and that no one that is honest and forthright will have any problem with it. And so what happens is that little by little we lose all of our personal liberties. Singapore is a good example of well intentioned

government run amuck.

If you drop a frog into boiling water, it will try to jump out. If you put it into a cold pot of water and slowly heat it up then by the time the frog figures out what is going on it is too late and he is cooked.

This is what is happening to all of our personal liberties. Gun banning radio banning, where will it stop?

Remember that without firearms and communications equipment there is not much that the people can do to rid themselves of an oppressive government. This is a very serious matter and our inaction today will leave a hell of a mess for our grandchildren.

It appears that the current administration is very sympathetic to the "ban-it" people.

Dangerous times indeed!

I understand everyone's concern... but last I heard is that there is a full federal pre-emption by FCC concerning this sort of thing for amateurs I suspect that it would be difficult to convince the cop on the beat that you are within your rights...and it might even take a court case to get it beaten into the state's head that the exemption exists... but it should be sufficient.

Am I wrong about this? And I would think that pointing out the exemption would certainly get the state to add amateurs to the list.

Any comments?

Traditionally the individuals involved in the radio hobby have not been highly motivated by wanting to make a profit from fellow hobbyists. How many times have you given a beginner a good deal on a used radio? How many times has someone given you a good deal? The radio hobby has always proceeded on the assumption that we will all attempt to act in the best interest of each other.

Of course, we expect companies to make a fair profit on equipment, and typically one has a different relationship with a profit-making company than with an individual, and has different expectations from that relationship.

What bothers me in this case is that an individual, whom we expect to act as a fellow hobbyist, is acting like a profit-making company. If the individual in question desires to make an income by lightly fleecing his fellow-hobbyists for soon-to-be-contraband items, well, I guess that tells us what kind of relationship he wants to have with the rest of us.

I am looking for more information on SMR (Specialized mobile radio).
Recently, I have heard a lot of talks about SMR being a direct competition to
cellular. My impression of SMR has always been radio used by police, taxi,
ambulance...etc. Has digital technology enable SMRs to function just like
a cellular?

I have seen a photo of a Motorola SMR phone which looks just like a cellular
phone. They claim cheaper price (like free local calls), superior coverage,
more features such as pager, messaging capabilities etc..
So what's the catch here? What is the limitation of SMR? Is it in anyway
superior to Cellular?
There are more and more infomercials about SMR licensing - is it a scam?

: Odds are the bill is the result of:
: 1- A request by the State Police and/or one or more of the various
: police associations that exist in the state,
: 2- The legislator's reaction to hearing about a crime that was
: committed where the criminals were using a scanner, or
: 3- Both 1 and 2 above.
According to my memory, which is as geting close to failure now
that I'm almost done with college (17 more days), there is a provision in
the FCC regulations reguarding scanners which already covers that. I
can't remember the EXACT number, but I think it's like Section 97 or
something like that, but what is says in part is "IF you are commiting a
crime, and you are useing a scanner to aid and abet your crime, and they
catch you/can prove it, you will have an additional 3 years in FEDERAL
prison time."

Understand, my mind is about toast now that it's getting down to
the wire for my schooling...so the numbers could be TOTALLY off...but the
gist of it is if you scanning while your a crook, you'll do MORE time.
As for State Police...well, I honestly think they need to deal more with
us citizens which listen to scanners just for the informational
value...and who want to become dispacters.

Happy scanning...

Bob, you have done a great service for your country. Having a single law such as this on the books anywhere in our country establishes a dangerous precedent. It is frightening to see that a single poorly advised legislator could actually cause such a dangerous breach in our liberties to occur with so little thought.

In law, precedent is everything. It is what the courts use to guide them in their decisions. Legislators use it as well.

One of the most troubling aspects of the so called "Scanner Ban" which is nearing complete implementation is that for the first time in out history, there is a law which declares specific frequencies off limits to reception. It is one thing to prohibit a specific class of service from being monitored, but it is quite another to restrict frequencies, which are a natural resource.

One can easily imagine someone somewhere at some time in the future using the cell band prohibition as justification by precedent for banning the police frequencies, or the fire frequencies or any other frequencies. In the limit it would appear all we wind up with is the Broadcast Bands and the Amateur bands. I don't know if you've read the specs on teh German version of the Icom R7100 or R7000, but that is about all the leave behind after hacking up a fine receiver.!

Howard Stern is coming up to Albany, NY tommorow, and I was wondering if anyone had any of his security's freq's. He will be staying (?), at least he will be having his political party meetings and stuff at the Ramada Inn. If anyone knows freqs for hotel security, or anything like that please let me know. Also, what is the general freq range that I should be searching in for this kind of thing??? Thanks

Bob (and everyone else):

Below is a copy of a post of this subject on Compuserve (where there has been much more traffic!). As a result of this, a friend here in St. Louis, MO took a day off to go stick up for everyone at this hearing on Thursday morning. Below is his post/results.... If you have a CI$ account, please send him a thank-you note. It's not often that you come across someone who is willing to take a day off work and drive 400 miles for something like this.
-Mike Baranowski

Thanks to Ted Moran's behind-the-scenes efforts, the original draft of Illinois House Bill 4180, which put pretty Draconian restrictions on scanner and Amateur equipment, has been abandonded. In its place will be an amendment which will supercede it in its entirety, and this new version will remain on the docket as HB 4180.

The new amendment - again thanks to Ted - will be styled after the recent Chicago scanner law, which makes it a crime to use a scanner in the commission of a crime. The final draft will not be available until tomorrow as wording and penalty details are polished. The author of the bill, Rep. Tom Cross, will be fax'ing the text to Ted Moran for final review before presentation to the General Assembly. The *amended* bill carries a "Do Pass" recommendation from the Judiciary II Committee.

We are not *entirely* out of the water, as the committee Chairman indicated that the revised bill is to be subject to full debate - he has the option of recommending "short debate", which curtails the amount of discussion and revision after committee review. If someone outside of Rep. Cross's office and the committee feels a need to beef it up again, then it *may* get altered. (I doubt this would happen. They are quickly approaching the end of the legislative season, and a "Do Pass" from a committee is a fairly strong stamp of approval. But write and/or call your representative, anyway.)

On a personal note, in meeting with Rep. Cross outside the committee chambers, I found him to be an extremely pleasant and well-intentioned individual, who very quickly realized the mess that was created in the original draft once the technical (electronic and legal) problems were highlighted by us. He was happy to accept the suggestions, and stated during the meeting that the original version being considered had numerous problems, and that he was drafting the new version in concert with the "individuals at the table" - us.

Hey, folks - how often do we get to write our own legislation, hmmm? I left the details to Ted, who could draw on his recent Chicago experience.
...mm

I'm not familiar with the Pro 43, but I sure do love my R1. It's got the kind of broadband coverage you're looking for, it performs well enough (of course it has its problems, but don't we all?), and its small size makes it extremely portable. I'd buy another in a minute!

Good luck.

Great! I hope that people who wrote to him to complain about Bill
4180 (& even those who didn't) will send him a card/letter THANKING HIM
for having the decency & integrity to pull the proposal, once he realized
that it would have a negative effect on law-abiding radio hobbyists.

Bob, can you post a mailing (& e-mail??) address for IL Rep. Cross?

Making it illegal to use a scanner during the commission of a crime is
nice, but anyone planning to pull an armed robbery on a liquor store
isn't going to leave his or her scanner at home, in fear of the
additional charge if they're caught.

With millions of scanners out there, the solution is for the law
enforcement agencies to encrypt their radio circuits. EVen this isn't
fool-proof, as a smart crook might look at the signal strength (on input
if over a repeater system) of the secure transmission & be able to
roughly determine the proximity of the po-lice... Despite my having
many scanners, as a taxpayer & member of society, I'm willing to pay my
share so that the law enforcement agencies can secure their transmissions.

Date: 1994-04-22 08:02:30 UTC
From: burke@ux4.cso.uiuc.edu
Message-ID: <2p80am$moe@vixen.cso.uiuc.edu>
Source record: 275223

P.J.Hinton@nd.edu (P.J. Hinton) writes:

>Could someone out there direct me to a useful reference
>listing HAM repeaters or even perhaps provide some of the frequecies used in
>the area near South Bend and Mishawaka? Thanks in advance.

The best reference is the ARRL Repeater Directory - $6 or possibly cheaper
at Hamfests. The 1991-92 edition lists the following frequencies in your area:

Mishawaka 147.09 South Bend 145.29
147.33 146.94
224.26 147.225
444.10 147.39
223.94
442.50
443.85
444.00

You'll find that most traffic exists on the 144-148 band, followed by 440 and
then 220.

> how to build a broadband downverter.

Either that, or ... if the RF circuitry can handle the locked-out range, ie if the limitations are strictly in the programming, a lot of other possibilities come to mind. If the programming is in a PROM, this of course can be changed.

The most ambitious approach would be to rip out the entire microprocessor and memory and replace them with something new. Remember, tuning the scanner is a matter of applying the right voltages to varactor diodes, programming frequency synthesizers, and so on. This simply involves getting the right logic states out of the right pins on the uP at the right times. If the factory-supplied uP can't be persuaded to emit a certain set of logic states at a certain set of times, it can be replaced with one that will. ("You can be replaced!")

Might as well add a bunch more features too. How about:

- built-in support for truly enormous memories

- adjustable bank limits

- selectable "bank sets" ("I want my virtual banks 1 through 10 to be physical banks 23, 2, 19, 45, ...")

- automatic search-and-store, recording number of hits on each frequency so stored

- channel pairs for repeater uplink/downlink pairs (when carrier drops on one channel of a pair, scanner automatically looks at the other half of the pair for the next signal, before reverting to general scan)

and, of course,

- a high-speed EIA232 port, designed in from the beginning, with provision for uploading and downloading channel memories, full control of scanner, full readout of scanner condition, etc., etc.

Steve Wilson urges hams to write to their representatives to exempt hams. First this is real shortsighted of him to want to look out for only a select group. This efects everyone whether you own a scanner or not. This is an erosion of your liberties plain and simple. If we let our neighbor be effected then surely we are next. While I do not ordenarilly agree with the NRA in their approach that even a little bit is too much, I am beginning to agree that they may be right. Our liberties are being nibbled to extinction, rather than being done away with wholesale. If we simply sit and wait for the next guy to act then we are going to be sitting on our asses when they open the door and take what ever they decide you aren't allowed to watch, listen to read etc... Paranoid? Maybe but it is slowly happening. Remember you can beat someone to death with a wiffle bat. It just takes a lot longer!

I had a R1 and was lucky to sell it for what I paid (got it from Japan).
Icom tried to put too much radio in too small a package. The cellular was
unsearchable and other nasty things showed up all over the public service
bands. The SW and AM were very marginal. Get a PRO-43, far fewer problems.

My 2 cents.

Gary

I, for one, am smarter than a frog, and that is exactly the point.

You are using precisely the same convincing illogic that allows Catherine McKinnon to equate pornography and murder in courts of law. Radicalism of the left and right are more similar to each other than either is to moderation.

Because two ideas, carried to their extremes, share certain elements, they must therefore be identical. Nonsense.

Every significant constitutional issue is about balancing rights one against another. The Supreme Courts doesn't sit back and ask themselves "are we going to grant them their constitutional rights today? It's Thursday. Today we deny them their constitutional rights." Give these guys some credit. Its about which rights are judged most important, which arguments are the most compelling.

It is undeniable that gun control and the control of communications devices (I hesitate to lump them together, for the analogy is a poor one), taken to extreme, constitutes a serious breach of our fundamental rights. It's the job of the courts and of the legislature (a job which the supreme court, at least, takes very seriously) to determine when a law has gone too far.

If we're all as stupid as frogs such a subtle and complex system will fail. And there's a lot of indication that that might be what's happening. But the answer is for us all to somehow gain a little more subtlety in our thinking, not to fall back on radical stands that deny the complexity of the problems.

If I'm in a pot of warm water, I might find it pleasurable for a while. If I sense that the heat is being turned up, I'll be wary, but I'm not gonna start jerking around like a hot frog. If the water begins to get too hot (and it's not anywhere near that point now) I'll get out and see what I can do about it. As long as I think there's a good reason for turning up the heat, and as long as I'm not too close to cooked, and as long as I'm convinced that there's a limit on how far they'll turn it up, I'll tolerate it and support it.

We've got housewives blowing away foreigners and getting off for it, gangs using anti-tank weapons on police cars, and murder rates many thousands of times as large as comparable European nations (just as free--in some respects more so). I think it's time to turn up the heat a little bit.

Jim Austin

Bi> Jerry,
Bi> Nice to meet you on the here on the net. I read with interest your
Bi> list of freq's in DuPage county.

Bi> I often listen to DuPage County Sheriff, Woodridge, Naperville and
Bi> Lisle.

Bi> The parts I do not understand are the signals and codes used. For
Bi> example, a DPS might say a "181" or a"330." Woodridge might use a
Bi> four digit code. Where can I find a list of these codes.

Those codes signals are used for describing the type of action
provided. They also indicate what type of crime.

Example: DPS code 28-9 is a disturbance call that is unfounded
any code ending in 9 is unfounded.

Units on DuComm often call in with a signal "9"
their code for a traffic stop.

I have the complete and authentic list for DPS but releasing that
info over the internet is in my opinion, a bad idea. I wish to
preserve their security as these haven't been published in any
scanner books. The codes for DuComm are widely availible.

I see you live in Naperville, I do also. I'm usually on
AFAR UHF 444.300 114.8 PL. You can't miss me on the air as I
use Motorola radios with MDC-1200 unit ID on key-up.

My thoughts exactly. My town of Naperville has a trunked system
from you guys, yet they still manage to fiddle with the Emergency
Man-Down button causing all sorts of trouble. Ah, trunking.....

>enforcement agencies to encrypt their radio circuits. EVen this isn't

The last thing I want to see happen is for the local police to encrypt
their communications. This is a really dumb idea. The reason is is a dumb
idea is because the police need to know that we can monitor what they
are doing. Otherwise the very arrogant police (around here they are)
get even more so. Remember the "gorillas in the mist" comments in the
wake of the Rodney King beating? Well this sort of crap will become
rampant as soon as the local fuzz are running crypto. It is always
tempting to the techno oriented folks to assume that technology is
the solution to everything. I like technology, it has its place,
but this is not where it should be used.

Crypto is fine for the military, but not for the police. I know
I want to know that these guys are on the up and up, because
we have so many cases of them not being so. One of the most
dangerous combinations I can imagine is a disarmed public
incapable of monitoring the law enforcement authorities.

It is time to go back an re-think the problem and the solution.

>>Is it possible to lock out any of these channels while in the P-SCAN MODE ?

The channel skip function does not operate while in P-SCAN mode. This good in some situations, but not in yours. It's good when you want to increase the number of virtual scanning banks when some banks have 10 or less frequencies: mark the 10-or-less group as skip channels, but also write them to P-SCAN memories. Then you can scan either group independent of each other.

One major advantage of a trunked radio system is that they make it very difficult to monitor a particular talk group. On any given repeater, the conversation immediately following the police dispatcher might be a garbage truck (assuming municipal system).

To answer your question, the control channel of a Smartnet I trunked system sends the following data stream:

1) Background Data Word (BDW) - 3600 baud with pattern 0B19DF00, used for sync only, tells the mobiles this is a Motorola system.

2) System ID Outbound Signal Word (OSW) - inserted into the BDW at least once every 3 seconds. Contains the system ID and control channel information.

3) Grant/Busy OSW - contains fleet, subfleet, individual mobile ID, and voice channel assignment or status information.

When a mobile hits PTT, it sends in an Inbound Signal Word (ISW) requesting a channel. The controller looks for an open frequency, if one is available, it will send out the information instructing the radios that are "turned" to that talk group to change over to the open frequency.

The Grant/Busy OSW contains information about all of the currently assigned channels. That way, a user that turns his radio on during the middle of a conversation will change over to the channel so he can listen in. Also, a mobile might go into a fade situation (under a bridge, behind a building, etc.), causing it to lose contact. No problem, the mobile goes back to the control channel, hears the Grant/Busy OSW, and knows what channel to go back to.

At the beginning of a conversation, the assigned talk channel sends out a high speed handshake (3600 baud). This is the same info as the Grant/Busy OSW and serves as a double check to make sure that all of the radios that switched over were supposed to. A low speed handshake (150 baud) is sent out durring the conversation to keep the radios on the channel. As mentioned above, a mobile that looses the low speed HS will revert back to the control channel. When the conversation is complete, a disconnect word (300 baud) is sent out to mute the mobiles and send them back to the control channel.

The mobiles also send out a connect tone when they are talking on a channel. This is like a PL, but is the same for every talk group on the system. When the user unkeys the mic, a disconnect tone is sent (163Hz) to tell the system the conversation is finished. Depending on the system configuration, this either starts the hang timer or drops the channel immediately.

I hope I did not bore everyone with the details. All of the above reasons contribute to the difficulty in monitoring trunked systems. From a design point of view, trunked systems are great. I get a lot of flexability and functionality in a system that is spectrum efficient. And there is a benefit to having a system that is harder to monitor. We have a scanner in our shop to monitor our system. We can't use it to follow a conversation, only the check the performance of the individual channels. I have to use my trunked portable to follow conversations.

Just my 4 cents worth (too long for 2 cents),
David

Why would you expect an Illinois state legislator to show up on a Congressional list?

There were some posts on CI$ yesterday to the effect that there was suppose to be a hearing on this bill yesterday evening. It seems that the push behind the bill is the fear that gang members are starting to carry scanners to monitor the police. I would imagine that this has the gangs quivering in their boots :-(

Glad you think so. Please express your dissatisfaction
to Sen. Coats of Indiana, who was most strongly *opposed* to the
scanner ban and tell him you're interested in seeing it repealed.

Last I knew, he and a few others were still interested in this....

And by all means, sound out your own congresscritters about
this and lobby them to support the repeal of this horrible law.

>One can easily imagine someone somewhere at some time in the future
>using the cell band prohibition as justification by precedent for
>banning the police frequencies, or the fire frequencies or any other

>the Broadcast Bands and the Amateur bands. I don't know if you've
>read the specs on teh German version of the Icom R7100 or R7000, but
>that is about all the leave behind after hacking up a fine receiver.!

More than likely, it will be a private enterprise. Since
the FCC is now engaging in this "spectrum auction" shit, what
you'll see happening is some other industry group who "buys" a
chunk of spectrum much like the cell-phone people did, and then
throws money around to get it declared sacred, much like the
cell-phone people did.

I think we need to form an organization, something along
the lines of "Taxpayers for Spectral Freedom" or something along
those manner of thinking. If we could come up with a cute Acronym
that spells "S.C.A.N." or "SCANNER" or something like that, it
might be amusing if nothing else, and catchy and easy to remember.

Obviously the "S" could stand for "Spectrum"..... :-)

>many times has someone given you a good deal? The radio hobby has always
>proceeded on the assumption that we will all attempt to act in the best
>interest of each other.
>

This is, of course, one person's opinion. How many times have we been to hamfests and seen the same hobbyist guys out in the same parking slots trying to sell the same stuff for the same prices that are too high?

No one is trying to rip off anyone. There is nothing immoral about making a buck when supply and demand changes. If you doubt this, look at the commodities markets. There will be a frost in Brazil and guess what, coffee prices rise. This happens all the time. Individuals can benefit as well. For example I often trade stocks in the anticipation of making a profit.

I have given many beginners excellent deals on truly excellent equipment and gone way out of my way to provide useful help. This will not change.

If your job had you travelling to Tokyo frequently and you knew you could pick up an extra scanner that was highly sought after in the US and you knew you could make $100 off of it, wouldn't you be tempted to do so?

Another way of looking at what is going on is that we are just establishing what the fair market value is for a commodity after a trade restriction is put in place. Whenever the government does things like that, there are always winners and losers. This is the free market system.

No one is not acting in the best interst of the hobby. I am no different than the guy offering an NRD525 for $975 that I recently saw advertsied on the net. His price is way out of line with recent prices and no one is flaming him. The difference here is that I am being totally open about the fact that I intend to profit from a windfall opportunity, just the same as you would if you had rental houses and there was suddenly a major run-up in house rental prices.

Maybe the openness is disturbing to you and others? Maybe you like your speculators to be more discreet about how they conduct their affairs? I think the whole thing is a fascinating thing to observe

because we see a classic market action in place before our eyes in slow motion. There is clearly a disruption in supply. Everybody knows prices are going to be affected. No one knows how much. There is clearly a spread between the bid and asked prices and they will converge.

Where will they stabilize? Maybe $700, maybe $800, maybe $600? I don't know but I am betting my own money that they will stabilize closer to the $700 I ask than the $580 you can buy them for in Canada. At least in the US that is.

--

Someone asked about how many I brought in. Well I travelled with three folks and each of us got a legal number of them. The other guys decided they liked the idea of making a few bucks so I offered to handle disposing of them. No one person brought more than two in. One guy kept one for himself.

We each told Customs what we had, paid our duty and left the airport. No one asked us about any FCC forms etc. If the Government needs special forms and declarations filled out, then they should be efficient enough` to make this information available to those charged with enforcing the laws.

If we had been informed that we had to keep these devices, then that is what we would have done. The risk is borne by the speculator. Everyone understands this. When you speculate, sometimes you win, sometimes you lose.

Hillary Clinton understands this!

>What bothers me in this case is that an individual, whom we expect to
>act as a fellow hobbyist, is acting like a profit-making company.

You should speak for yourself. It is not clear to me based on reading recent posts by Mr Miller and Dr. Wier that your opinion is held by all. Furthermore, I would argue that I am acting just like a great many hobbyists that haunt the great flea markets. Everyone out there selling is trying to make a buck, mainly to allow them to engage in a bigger way their hobby. This is the American way and if you have a problem with it, then you will simply be a bothered person.

>If the individual in question desires to make an income by lightly
>fleecing his fellow-hobbyists for soon-to-be-contraband items, well,
>I guess that tells us what kind of relationship he wants to have with
>the rest of us.

Again, I have time and again offered advice, sold good equipment at fair prices, and generally tried to contribute to the common knowledge base in this hobby. At the same time I see nothing wrong with making a buck in the process. We are simply establishing the new fair market price for a scarce commodity by this exercise.

Hmmm, this is certainly good news, but it is my understanding that the ECPA already makes it illegal to use a scanner in the commision of a crime. In fact, aren't crimes illegal? What good is making scanners illegal in the use of crimes if in fact crime is illegal, and yet still occurs? Sort of like the worthless feel-good gun banning agenda!

you are right! All of the crimes being committed by the gangs and other
violent members of our society are just that: crimes. Every drive
by shooting, crack deal and bank robbery are already crimes. Yet
so often once the perpetrators are arrested, convicted and confined they
are released from jail way before the sentence clock expires. I am
very reluctant to accept new laws further infringing my personal
liberties when I know the acts that I am to be protected from are
already crimes and the perps are not being held fully accountable for
their actions. The penal and parole system in this country are
seriously broken and passing more laws further restricting your and my
liberty will do nothing to correct that fact.

Correct me if I'm wrong . . .

After April 26, not only will it be illegal to import or manufacture scanners (being interpreted my the manufacturers to *include* transceivers) that receive the forbidden frequencies, but it will be illegal to build your own.

I don't know how this relates to scanners that are already modifiable. Right now, it's not illegal to modify your scanner for extended RX or, at least, I haven't heard anyone make the claim that it is. So all the fiddling around and modifications are within the law (just don't listen). I don't know how this will change after April 26.

Water selling for $10 per gallon in a drought encourages those with water to bring it to those without, a positive event for those in need of water. Price controls result in no incentive to bring water in, and a continued shortage. When enough water is brought in, the price declines. Ditto for plywood.

If you don't like the price, don't pay it. Please take your complaints to alt.socialism.

|I, for one, am smarter than a frog, and that is exactly the point.

|You are using precisely the same convincing illogic that allows Catherine
|McKinnon to equate pornography and murder in courts of law. Radicalism
|of the left and right are more similar to each other than either is to
|moderation.

And also irrelevant. Being "smarter than a frog" i.e. an "intellectual" doesn't mean squat in the face of deadly force. All the brainpower in the world didn't mean diddly to Pol Pot's soldiers when they emptied the cities and cleansed Cambodia of their intellectuals. And who can forget the Peoples Republic of China and what the Red Guard did to their intellectuals?

If you haven't seen "Schindler's List" yet, I suggest you do. There's a scene in there where an "intellectual," a civil engineer, objects to some particular aspect of the construction of a building. Yes, Mr. Engineer is quite proud of his intellect in telling his Nazi captors that they are incorrectly constructing a building. The Nazi captors shoot him, and then adopt his engineering change to the building.

Being "smarter than a frog" doesn't stop government soldiers from killing you; being "smarter than a frog" and equipping yourself with an AR-15 or AK-47 can. Which is precisely what the attacks on civilian owned military-style semi-automatics are all about in the USA.

Well, my friend just called to say he'd bought the last MVT-7100 Lorenz had in stock, promised for Monday or Tuesday delivery.

You might get one in time from Javiation, otherwise, you'll have to pay Richard Crisp for his foresight! Used ones do show up--I bought my 7100 used for $450 last November.

The people we ought to be flaming are the fools who voted for this dumb law. Without it, I probably never would have bought a scanner in the first place. Now I own two and listen frequently. Good work, Congress!

Good listening.

Jim (I got mine) Kearman

I just got a PRO-46 and would like some feedback from experts before my 30-day chance to return it expires? I'm new to this, but the 46 had a good sale price so I took the plunge. I looked at the PRO-39 too. WHat is HYPERSCAN and does it make a big difference? I mainly want to monitor cordless phone, would hyperscan help that? Thanks for the advice, I'm just learning so I need all the help I can get! -- Paul --

2946. Mods for PRO-46?

Newsgroup: rec.radio.scanner
Date: 1994-04-22 19:08:16 UTC
From: Jerry.Smith@f747.n115.z1.fidonet.org
Message-ID: <2db8a411@f747.n115.z1.fidonet.org>
Source record: 275247

tr> I am looking for any mods for the PRO-46. I have mods for almost any
tr> other "PRO" series scanner.
tr> Thanks in advance,

Here you go, Fred...

Product: Realistic PRO-46 by Radio Shack
Purpose: Restoration of full 800 Mhz coverage

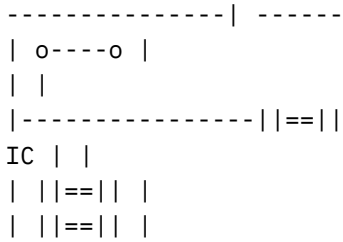
The modification of this unit is from the May, 1993 issue of
Monitoring Times, published by Grove Enterprises.

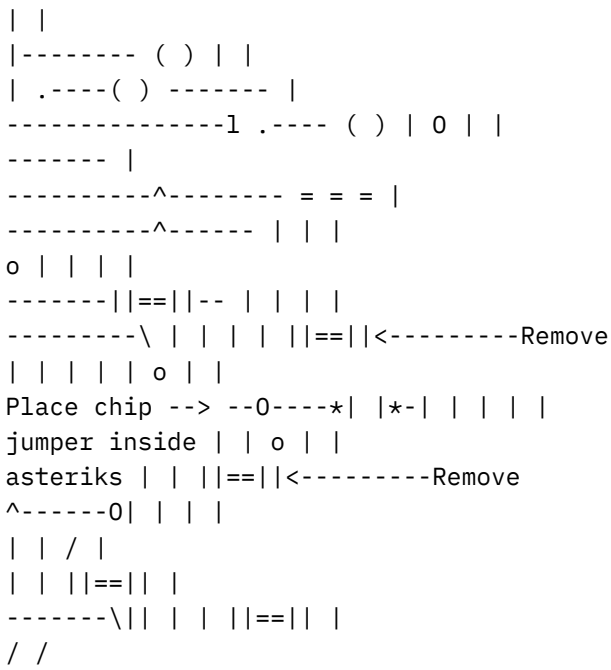
** Disclaimer: All modifications are done at your own risk. This
product uses surface mount components which can be easily damaged.
Do not perform this modification if you are not experienced with
this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted
by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping
available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then
push upward on the bottom of the rear of the case, carefully
swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards
next to the interconnect plug in the lower right corner. Gently
pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. ** CAUTION!! Too much heat will damage the
shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder
and remove both.
6. Solder one chip jumper across the two upper most unused solder
pads. (Soldering a jumper across the lower two pads changes the
30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.





Jerry

>

The frog analogy apparently wasn't good enough to get my point across:

The point I am trying to make is there is a insidious chipping away at our
liberties that is occurring. If the government did everything all at once,
there would be rioting in the streets. They are too smart for that they
do it a little at a time. First we saw RICO being passed to combat organized
crime. This is a good thing. Now we see it being twisted around being used
for things it was never intended for such as attacking pro-lifer's attempts
to shut down abortion clinics. Then we have the whole gun control farce,
and now radio bans. The point is if in 1992 all of this was attempted, there

would have been zero chance that it would have made it into law
and if it did there may well have been rioting in the streets.But little
by little you and I have fewer liberties now than we did 20 years ago,
and are no safer or better off for it.

Those that stand by and do nothing are no better than a frog. Parnass
did the right thing by contacting and educating Mr Cross. We all owe him
a big thanks. Many many bad laws are railroaded through by well intentioned
people that simply do not understand or care about the full ramifications
of their action.

I'd also like to see a bit of tie in to specific acts where anti tank
weapons have been used against police cars and a bit more info on the house
wife that blew away foriegners and got away with it.

>After April 26, not only will it be illegal to import or manufacture scanners
>(being interpreted my the manufacturers to *include* transceivers) that receive
>the forbidden frequencies, but it will be illegal to build your own.

The law prohibits manufacture, not home built. Now one might argue
that the ban on manufacturing could also be applied against an
individual who builds just one unit, but I really doubt it.
I think the term manufacture implies a true business endeavor (i.e.
assembly line, many units built, etc.) Bottom line is that even
if you were illegally building your own, how would anyone
determine when you built it (before or after 4/26/94)?

Remember too, no one appears to have been prosecuted for ever
listening to cellular, ECPA law or not. I really don't think
the Feds would care at all about someone building their own
equipment, indeed, how would anyone ever know about it
anyway?

>I don't know how this relates to scanners that are already modifiable. Right
>now, it's not illegal to modify your scanner for extended RX or, at least, I
>haven't heard anyone make the claim that it is. So all the fiddling around and
>modifications are within the law (just don't listen). I don't know how this
>will change after April 26.

It won't change at all. The 4/26 date is the cutoff for importation and
manufacture. Nothing in the 4/26 effective law prohibits modification.

You are right, and Reagan signed the ECPA and the Machine gun ban of
1986.

The point I am making is that there is a furor or gun banning
sentiment unseen in the history of this country underway now.
And the current Administration is certainly fueling the fire.

And the ill-advised Brady Bill was signed by our number one draft dodger!

Why only in Nova Scotia ? I saw a comment about a RS sale (can't remember what item) in NS and found that it was not true for RS in Ontario. Sales in Ontario were different than in US. But sales in Missouri are the same in MI and NY etc. Why ? Are there separate RS empires up there ?

Someone wants to sell me a Bearcat 142XL.
1. What features does it have?
2. What is the frequency range?
3. What's it worth?
4. It it worth picking up? I have three RS scanners now.
5. Can it be modified (Cel phone freqs)?

2957. IL LAW UPDATE

Newsgroup: rec.radio.scanner
Date: 1994-04-22 22:11:28 UTC
From: Ted.Moran@f747.n115.z1.fidonet.org
Message-ID: <2db83d80@f747.n115.z1.fidonet.org>
Source record: 275258

From the Chicago Area Radio Monitoring Association, 6143 W. Touhy Ave, Chicago, Illinois, 60646. Voice - (312) 631-5560 FAX-(312) 631-6499

We attended a committee meeting of the Illinois House Judiciary 2 panel on April 21st in Springfield. Among the bills discussed was House Bill 4180, which in it's original form makes illegal the possession of any scanner that can be DC power operated. Other than our group of 3 hobbyists only one other person showed up to support our cause. He was a amateur radio operator from out of state. This was a far cry from the show of force we had hoped for.

Before and after the committee meeting we seemed to make some progress with the bill's sponsor, Rep. Tom Cross, along the lines of getting the bill re-written (amended) to resemble the current Chicago City law, which makes it a crime to use a radio to aid or abet the commission of any other crime. We are withholding judgment on the matter until we see this re-written version. This will probably happen on 24 April, 94, and we will keep you posted.

Our testimony with the committee was rather heated at times. They did not appear to be willing to recognize that scanner listening is a legitimate hobby. The overall atmosphere of the committee did not seem favorable to our cause. The committee chairman introduced Representative Frias to testify for the bill, and identified him as a Chicago Police Officer. During his testimony, Rep. Frias stated; "It's vitally important that we (the Illinois House of Representatives) immediately start taking some steps to prevent citizens from monitoring police frequencies."

This Bill was proposed by Rep. Tom Cross, from Yorkville, Illinois. His Yorkville office number is (708) 553-0000. His Springfield Office number is (217) 782-1331. While Rep. Cross appears to be willing to work with us in re-writing this bill (HB4180), it's vitally important that you express your feelings about this to him. We don't want him to change his mind at the last minute.

Should you care to discuss his position regarding the right of law abiding citizens to monitor publicly owned airwaves passing through their homes, Representative Rafael "Ray" Frias (Democrat - 1st Ward / Chicago) may be reached via his Chicago office at 4106 S. California, Chgo, IL, 60632 (312) 890-0125. His Springfield Office phone number is (217) 782-3316.

No one we spoke with mentioned receiving any feedback on this issue from their constituents. We were saddened by the lack of turnout at

the committee hearing. In comparison, the committee voted against a gun control measure. This may have been the result of the room being packed with Illinois NRA members. It would appear the committee members feel radios are more dangerous than guns.

We can guarantee that if the hobby community does not stand up for it's rights it is going to lose them and the hobby along with it. We really will not be interested in hearing your moans when your radios are confiscated unless you have done something to prevent this from happening. Dont sit back and think that there is nothing you can do. There is a lot you can do and now is the time to do it. Make a call, make a lot of calls, tell other hobbyists, write a letter, write a lot of letters, repost this message on other hobby BBS systems. Tell your Illinois House Representative that you are a law abiding citizen who supports law enforcement and that you dont want them to take away your radio.

We will post here on Monday evening and let you know if the bill has been changed to permit the ownership of radios by law abiding citizens. The current status of the bill may be checked by calling the clerks office in Springfield - (217) 782-7192. Happy Scanning - Ted Moran, editor CARMA Newsletter

Source record: 275259

I am selling my Icom R-1. I don't really listen to anything but police and ham radio, so I find no need for it's extensive features.

For those unfamilliar with the R-1, the following is a list of features (from my memory):

- Full coverage from 0.5 to 1300 Mhz
- Smallest scanner produced (about 2" x 1.5" x 4")
- Wideband FM (TV, Radio), Narrow FM (police, cellular), and AM modes for any frequency
- 0.5, 1, 5, 10, 12.5, 25, 30, and 50 kHz step rates (receives any form of transmission)
- Programable Search limits (ex. will search from 860-890 MHz), with any channel spacing (useful for cellular - will effectively scann every single cellular channel while only taking up two numers in the memory.
- "Search and Store" function - searches for activity in a specified range of frequencies and stores any found (great for finding unknown frequencies)
- Runs about 8 hours on internal battery, or runs for days with optional battery pack (I don't have that, though)
- All kinds of other functions that I haven't even learned how to use yet!

The scanner has ALL accessories, as well as the directions, box, and packaging. I think the scanner retails for about $400 from Grove (I'm not sure of the exact price, but it's somewhere around there - check for yourself). I am selling the unit for $295, which seems to be the average price on the net. The scanner has no scratches or damage of any kind.

Please respond directly to me.

>answer is for us all to somehow gain a little more subtlety in our thinking,
>not to fall back on radical stands that deny the complexity of the problems.

The problem isn't that we aren't thinking correctly, it is that we are
being fed incorrect information on which to apply the thinking,
subtlely or otherwise. See Nightline last night? We are scaring
ourselves into giving up our liberties.

>If I'm in a pot of warm water, I might find it pleasurable for a while. If I
>sense that the heat is being turned up, I'll be wary, but I'm not gonna start
>jerking around like a hot frog. If the water begins to get too hot (and it's
>not anywhere near that point now) I'll get out and see what I can do about it.

Yeah, but what if they make you think the water is cold, when its not ?
You'll beg to have the heat turned up.

>As long as I think there's a good reason for turning up the heat,

CRIME INCREASING DRAMATICALLY !! (_not_, its actually going down,but thats
what they feed us)

>and as long as I'm not too close to cooked,

YOU DON"T NEED THESE UNIMPORTANT RIGHTS ANYWAY !! (remember, no one _needs_
a nasty, evil baby killing assault weapon)

>and as long as I'm convinced that there's a limit on how far they'll turn
>it up,

REALLY, WE DON'T WANT YOUR "SPORTING" GUNS !! (see .sig below, still
convinced ?)

>I'll tolerate it and support it.

THE FROGS ARE BEGGING FOR MORE HEAT, ER, WE MEAN THE PEOPLE ARE BEGGING
FOR GUN CONTROL !!

>We've got housewives blowing away foreigners and getting off for it,

Where? A lot? Come on!

>gangs using anti-tank weapons on police cars,

a) Anti-tank weapons are illegal, last I checked, anyway overkill on a car.
b) Where? A lot? Come on!

>and murder rates many thousands of times as large as comparable European
>nations (just as free--in some respects more so).

Yeah, like Switzerland, where 40% of the homes are equipped with government
issue assault rifles, personal anti-tank weapons, and private firearms.

>I think it's time to turn up the heat a little bit.

The problem with this analogy is that there is only one possible
response, turn up the heat.

The problem with your thinking is that there is only one response,
restrict freedom.

This is a not an analogy, this is life.
We can lower crime without banning guns or radios, if we want to.
We can also alow crime to rise WHILE we ban guns and radios, if we want to.
Choose.

Steve, I won't comment on whether what Richard did was legal or not
because I'm not an attorney. However I have to wonder why you and
others are bitching so strongly about this. ANYONE could have bought
a Yupi from the stateside sellers, or from Javation, etc., for the past
year or so. If they wanted to wait until now and wring their hands
over not doing so, and/or sustain the added expense of pre-ban prices,
that's their problem. Richard is doing them a service by making the
units available. I'm willing to be that that he's perhaps cleared
enough to pay for shipping, plus perhaps pay for one for himself.
Such is the American Way. He's not hurting anyone by what he's
doing. Lay off eh?

Just FYI...I spoke with the FCC today regarding importing non-FCC certified equipment by individuals. I was surprised to find out that it is illegal for one to re-sell non-FCC certified devices, whether a company or an individual. One can import these devices for personal use, and that is it. I guess it gets to the same thing a ticket scalping. I will sell you this pencil for $600, and give you this radio for free....Hmmm. I am going to obtain a copy of the FCC codes just to confirm this and see exactly how it is written.

I was given an antenna that is supposed to be able to work with my scanner.
I dont know the brand name, but it is about 12 feet long, and has about
1 1/2 foot attachments on it. It looks something like this:

```
\ /
\ /
---------------o----------------
/ | \
/ | \
|
```

Anyone know the type, frequencies, or anything usefull?

It has a regular screw in coax connector.

-Keith

2971. Got my first scanner

Newsgroup: rec.radio.scanner
Date: 1994-04-23 05:35:57 UTC
From: hayden@krypton.mankato.msus.edu
Message-ID: <1994Apr23.003557.4968@vax1.mankato.msus.edu>
Source record: 275272

I just wanted to pass along to everyone a quick report.

I'm VERY new to scanning, but have been meaning to get a scanner for quite a few years. Anyways. I finally broke down and decided to spend the cash.

After taking a look at the high-end hand-helds, it came down to either thr PRO-43 or the Bearcat 2500XLT. I decided to get the bearcat, dispite the review someone mailed me that pointed out intermod problems. I don't live in a big city, so there is very little traffic here.

Anyways, I mail-ordered the scanner from Communications Electronics Inc. for a price of $329 (there was a $25 coupon in in the last edition of PC). It arrived in less than a week.

I had a list of frequencies that a local radio buff had given me for the local police, and without having to even read a manual I was able to punch them in and get the unit scanning. First report, a three-car hit-n-run.

I'm really quite happy with the scanner. It seems well made and has oodles of features to meet almost any need. With 400 channels (20 banks of 20), I shoudl have more than enough playing room. I won't list the individual features of the unit as that has been done previous.

I will, though, point out a couple of small complaints that I have. Most of these are more questions of ergonomics than anything.

1) When you lock the keyboard out, you can no longer utilize the light. It'd be nice to be able to lock out the keyboard but still turn it on, since fumbling in the dark you are sure to mess something up with an unlocked keyboard.

2) There is no way to go directly to a channel or bank. Either you have to page up/down with a button or use the rotary knob. it'd be nice to be able to at least designate a bank to go directly to and then you could fine-tune with button or knob.

3) The 'leather-like" carrying case is REALLY cheap. One good jolt while it is hanging on your belt and it seems like it'd be torn apart. I don't know if there is a 3rd party manufacturer of a better case, but the stock one really is flimzy.

4) When in scan mode, the word 'SCAN' scrolls across the face. Maybe it's just me, but I wanna see numbers flashing! No biggie, just something that bothered me :-)

5) Black LED is hard to read. I'd like to have that florescent
green on black for a display. Then there'd be no need for a light
either. You know the colour I mean, you've seen it on construction signs
and the like. It can be seen equally well in both light and dark.

Anyways, dispite the above, it's a good unit and I'm happy with it. As
this is the first hand-held I've owned, and the first of this
high-quality, I don't have much of a comparison with other brands and
models out there, but for what I have seen, this is a good unit.

Kind of reminds me of fireworks - most of the stands you see now have a "buy one - get one FREE" offer. I've never found out why they do this. I figure it must be either a) to avoid paying sales tax on 1/2 of the sales or b) to get around some kind of law regarding selling explosives. Anyone know?

Please e-mail since this isn't really rec.radio.scanners...

THANKS

Scanner Antenna:

The limitations of drawing with ASCII characters may have been too great, but I think you have a discone. If so, it is broadband - which is why it is such good news for scanners; most antennas are single-band. The exact coverage depends on the length of the various elements and the angle of the elements to eachother.

In a previous article, U086236@adpdp2.lanl.gov (U086236) says:

>Someone wants to sell me a Bearcat 142XL.
> 1. What features does it have?
> 2. What is the frequency range?
> 3. What's it worth?
> 4. It it worth picking up? I have three RS scanners now.
> 5. Can it be modified (Cel phone freqs)?
>
This radio has 10 scan channels plus weather search. 29-54, 136-174,
and 406-412. Scan delay, one priority, channel lockout. No cellular, no
aircraft. Sells new for $69.95. For an extra 20 bucks you can get the
172, which scans 20 channels including aircraft.

You are right, and I should have noticed. There are a lot of us Yanks
that are monitoring Inmarsat and the interest has picked up immensely
after Montitoring Slime ran a two part series recently on Inmarsat.

Trouble is that when something like that comes up, it usually catches
the attention of the legislatures and hastens the onslaught of further
restrictive legislation. It is too bad that Grove et al has to hasten
the demise of the hobby they make their livlihood from. There are
a lot of interesting things in the air that no-one is talking about
and as far as I am concerned, it is better that way.

At Dayton, usually a group of us get together to talk about the untalkable.
That's the way to do it, and it is more fun that way too as it stays more
"under wraps".

2980. Two Way Radios

Newsgroup: rec.radio.scanner
Date: 1994-04-23 14:00:54 UTC
From: jkwiatkowski@attmail.com
Message-ID: <9404231400.AA08236@cs.utexas.edu>
Source record: 275131

If anyone has any two way radios on 154.570 or on any GMRS frequecies that they wish to sell,please contact me at my e-mail address above.I know this isn't necessarily the correct list for this,but thought I'd mention it anyway.
Also,I am trying to locate local frequencies that are used by a local Police Department but I find that they have some that don't seem to be published anywhere.how can I obtain that information??
John

CHP Mobile Extenders

154.905 Ch 1 (Extender operation)
154.920 Ch 2 (Interagency operation)

The mobile extender system allows the officer to communicate using a portable radio on his belt. The car radio repeats to and from the portable so the officer will be in touch with the dispatcher at all times. This system operates at a 1/4 watt and is limited in range.

>to the same thing a ticket scalping. I will sell you this pencil for $600, and
>give you this radio for free....Hmmm. I am going to obtain a copy of the FCC
>codes just to confirm this and see exactly how it is written.
>
>-Mike

FYI, all offers to sell the last Yupiteru are hereby withdrawn. The importer
has decided to keep it for himself citing the bellyaching by the crybabies
in the net and the FCC issue. You guys have won, we are scum and hereby
apologize to all for our sin of being capitalists.

Hail Comrade!

Stretch, Bay Area Scanner Enthusiasts

2985. Rochester area scannists

Newsgroup: rec.radio.scanner
Date: 1994-04-23 15:56:02 UTC
From: David.Stark@p2.f333.n2613.z1.fidonet.org
Message-ID: <767126101.AA09911@rochgte.fidonet.org>
Source record: 275136

A couple of weeks ago I posted a message about starting a scanner notification service in the Rochester, NY area. Only 3 local people expressed any interest. I guess I may have put the cart before the horse, so here is a more basic idea that may be better:

Scanner radio enthusiasts in the Greater Rochester (NY) area are invited to help form a new radio club. Many of us already belong to national or regional scanner groups, but none are able to concentrate as much as we would like on local issues. And none provide the regular face-to-face contact that makes sharing common interests even more enjoyable.

To allow for relatively easy travel to club meetings, as well as serving an area of manageable size with a notification network, I am inviting potential members from the following counties initially:

Monroe, Wayne, Ontario, Livingston, Genesee and Orleans.

If scannists from more distant counties such as Cayuga, Yates, Wyoming or wherever would like to be included, you are most welcome.

Potential benefits of a local scanning club include:

Rapid dissemination of radio system changes.
Group purchase power for scanners and accessories.
A common voice in legislative issues affecting our hobby.
(Did you know that Rochester has an ordinance banning
ALL portable and mobile scanner use without a permit?)
Notification of major incidents when we are away from our scanners.
(More on this in a moment.)
Personal acquaintance with others who share your monitoring
interests and specialties.
Help from more experienced scannists to improve your hobby.

What about this notification thing?

Many communities on the US coasts have notification networks that use either 2-way GMRS radios or alphanumeric pagers to alert members to significant events. Several of these groups share information with each other, so members can optionally receive alerts for newsworthy major incidents in locations far out of their scanners' range.

Most notification networks have dispatchers who monitor scanners and receive telephone tips from members. They relay the information to the rest of the group. Some dispatchers are paid and some are volunteer. Naturally, there is also some expense involved in using a paging service, or in having GMRS equipment. If our local scanning club wants to get involved in notification, we will have to find out what it

would cost and decide whether we want to spend the money on it.

If these ideas sound interesting to you, I will set up an informational meeting where we can decide what directions our new club will take and how it will operate. I need to know how many people to expect so that I can arrange for appropriate space. Please contact me by May 1, 1994.

Here's how to reach me:

By phone during evenings and weekends at (716) 254-1726.
By Internet electronic mail to david.stark@rochgte.fidonet.org
By US Mail to David Stark, 580 Seneca Pkwy, Rochester, NY, 14613-1020
By Fidonet Netmail to 1:2613/333.2

Thanks and 73 de NF2G.

2986. California Scanner Law

Newsgroup: rec.radio.scanner

Here is the text of the law pertaining to scanner use in the Golden State:

Section 636.5 Wrongful Interception and Divulgence of Police
Radio Communication.

Any person not authorized by the sender, who intercepts any
police radio service communications, by use of a scanner or other
means, for the purpose of using that communication to assist in the
commission of a criminal offense or to avoid or escape arrest, trial,
conviction, or punishment or who divulges to any person he or she knows
to be a suspect in the commission of any criminal offense, the
existence, contents, substance, purport, effect or meaning of that
communication concerning escape from arrest, trial, conviction, or
punishment is guilty of a misdemeanor.
Nothing in this section shall preclude prosecution of any person
under section 31 or 32.
As used in this section "police radio service communications"
means a communications authorized by the Federal Communications
Commission to be transmitted by a station in the police radio
service. Leg.H. 1976 ch. 1129, 1991 ch. 515.

It sure sounds like Richard is in the business of importing radios for the purposes of resale.

How does Illinois define a "member of the press?" If I send a videotape
to CNN Newshounds or publish things on the Internet, does that make me a
member of the press?

AD>But please get a second opinion before trying this.
```

Hey you guys. Batteries do not leak acid. They leak alkali, which can be nuetralized with acid. But don't bother. If you haven't already nuetralized it, then by now, atmospheric CO2 has. What's left? Just some solid potassium carbonate- just brush it off and forget about it. If no electronic damage has been done by now, your OK.

Looks kinda like Route 50 going across Nevada to me.

Actually, similar (?) to Scantenna in Grove catalog or Channel Master in AES catalog. The Grove one is 7.5 feet high, though. Other one doesn't say. Is this some kind of psychological test?

Yeah, but what if they make you think the water is cold, when its not ?
You'll beg to have the heat turned up.

>As long as I think there's a good reason for turning up the heat,

CRIME INCREASING DRAMATICALLY !! (_not_, its actually going down,but thats
what they feed us)

>and as long as I'm not too close to cooked,

YOU DON"T NEED THESE UNIMPORTANT RIGHTS ANYWAY !! (remember, no one _needs_
a nasty, evil baby killing assault weapon)

>and as long as I'm convinced that there's a limit on how far they'll turn
>it up,
ETC

You make some good points. I'm not going to fall into the trap of arguing
with something I agree with. I don't deny (in fact I assert) that the
extremists on both sides are out to lunch. When they come for my hunting
rifle I'll be standing there elbow to elbow with my neighbors, and mine'll
be loaded (and the shotgun, too).

But when they come for the guns built to kill people, they have my support.
Problem is, often as not that handgun Hank bought for Thelma to protect
herself when he's out of town ends up killing Hank, or one of the kids,
or some poor fellow who wants directions at 9 pm. It's not a real deterrent,
either to crime or to the latest oppressive regime.

I don't think too much of rights when they're only on paper. Show me the
real, tangible effect it has on people. I really don't see great harm in
controlling handguns, assault rifles, etc. I know people who collect them
who might be pissed off (at least until they realize how much it increases
the value of their collection). A few people are deprived of a hobby, and a
few others aren't deprived of their lives. Sounds like a good bargain to me.

I have this a suspicion that where your line of thinking ends up is in wealthy
suburban communities with big security fences and the latest alarm systems,
George cleaning his guns in the workshop for his weekend trip to the game farm
while Deloris does her nails and
outside the gate the less priviledged people live in fear.

If we can reduce crime more cheaply, lets do it. But I hope you've got
something better in mind than building more prisons and not coddling
the criminals.

Yeah, so I exaggerated. Next time I'll be more careful. You're right.
No question about it--
the crime problem is exaggerated (looks like I'm not helping things). We just had a little side show here in NC, where the governor called a special legistlative session on crime, and everybody took the opportunity to get their names in the paper and their faces on TV talking about how awful crime is. Meanwhile a local independent paper investigated the criminal records of the legislators, and found an extraordinarily high rate of felons. Also asked them about their support for the state sodomy law (yeah, we have one). About half a dozen expressed their support for the law, then when asked about their personal habits they all said it was "nun'v yur damn bizness." Go figure.

In any case, I stand by my main point, that it's wrong to equate the extreme with the middle. If I take one step west I'm not in San Francisco.

I found your little "translation" rather dull. Passing my words through an ideological filter doesn't reveal any deeper truth, but it does make them a little easier to understand.

Why to you "conservative" types always act like everybody else is an idiot?

Jim Austin

Most of these can be obtained from a variety of books that you can purchase at radio hobby stores.

On the other hand, I have an extensive collection of mostly simplex frequencies used in undercover and surveillance operations by federal state and local agencies in the LA area. I can e-mail or post these if there is any demand.

2998. Re: Mods for PRO-46?

Newsgroup: rec.radio.scanner
Date: 1994-04-23 21:42:08 UTC
From: strech1@aol.com
Message-ID: <2pc4ng$9gm@search01.news.aol.com>
Source record: 275148

In article <2p662h$htn@sndsu1.sinet.slb.com>,
trask@ASLVX1.SUGAR-LAND.ANADRILL.SLB.COM writes:

Mods For pro 46
RADIO SHACK PRO-46 CELLULAR MOD

Note: This modification will void your scanner's warranty. It is illegal
to monitor cellular telephone conversations.

1) Remove battery pack, antenna and back of radio (4 screws). Push up to
release rear of case.
2) Pry the top board off and out from the lower right corner (there is a
connector between the boards)
3) Unsolder the copper-coated plastic RF shield (don't overdo the heat).
4) Remove two chip jumpers imprinted with a "0" near each other at the
bottom of the board; one is above the other.
5) Between the jumpers and slightly to the left is another set of jumper pads;
solder one of the removed jumpers across them.
6) There is another set of pads below the ones you just jumpered;
connecting a jumper here switches the 30-50 MHz band to 68-88 MHz for
foreign use.
7) Reverse steps 1-3; that's it.

I have an illustrated version of this, it's easier to understand where the
unmarked jumpers and pads are, (and I'm no keyboard artist) Send a request to:
4108@mgs.com

and I'll try and send out a few....

2999. Opinions on AOR1000 or BC2500XLH

Newsgroup: rec.radio.scanner

> exclusively on alternating current power.

exCUSE me??? I could say lots about this law. (Like what, if any, are the provisions for grandfathering? If they want to ban use of scanners in cars, that's one thing--but how can they ban a battery-powered radio used in your own home? And are they aware of a little gadget, I believe around $100, that will allow you to operate AC-powered devices from you car cigarette lighter?)

But what I really want to know is, what did the "members of the press" do to deserve an exemption? No offense to any journalists reading this, but they are civilians, and not (it seems to me) deserving of any special privileges we mere consumers of the mass media are not entitled to.

3006. Icom R1 filter bandwidth

Newsgroup: rec.radio.scanner
Date: 1994-04-24 02:38:07 UTC
From: jpotts@crl.com
Message-ID: <2pcm2f$bcf@crl2.crl.com>
Source record: 275155

I am interested in improving the selectivity of the Icom R1. I am experienced in soldering surface mount components so I am not worried about working on the radio. I need to know which of the three filters is the cause of the poor performance. It is most likely the 10.7 MHz or the 455KHz filter. Is there a drop in replacement filter that would do the job.

John Potts

>Steve KA6S

Yes, I've a comment. There's no reason for the law at all. Simply seeking an exemption for hams isn't the issue. That would still acknowledge the philosophical validity of the law.

I am d#### sick and tired of the friggin' government treating law abiding citizens as the criminals. If some jackass uses a scanner to show up at the scene of an emergency and get in the way, prosecute the jerk for interfering at the site of an emergency or something. Leave those of us who use a scanner to AVOID such things alone. I listen to the scanner if I go across town. If I hear of an accident on Hwy 1, I'll take Hwy 2. Who the hell wants to get tied up in the traffic mess around an accident? I'm not there, which should make the authorities happy. I'm not caught in the traffic jam, which definately makes ME happy. It's a win-win situation.

BTW, I'm an unhappy ham living in the state (oops, Commonwealth) of Virginia, the only state in the whole U S of A which still outlaws the private use of radar detectors. I guess it interferes with the state's being able to extract extra money from the populace.

Review Of Radio Shack Digital Signal Processor with Amplified Speaker

Catalog Number: 21-543
Price: $79.99

Specifications:

Frequency Response:

DSP Out Mode: 300-3000 Khz

NR Mode:
Wide Position: 200-2959 Khz
Med. Position: 200-2500 Khz
Narrow Position: 200-2000 Khz

CW Mode:
Wide Position: 269-1231 Hz
Med. Position: 500-2600 Hz
Narrow Position: 800-2000 Hz

SSB Mode:
Wide Position: 300-3000 Hz
Med. Position: 500-2600 Hz
Narrow Position: 800-2000 Hz

Total Harmonic Distortion: 1.0% Typical
S/N Ratio: 55 dB
Audio Input Level: 3 V Peak to Peak (Max)
Heterodyne Rejection: (SSB/NR mode) 40 dB (max)
Noise Reduction (NR Mode): 20 dB (Typical)

Dimensions: 1 15/16 X 4 9/16 X 7-1/16 inches
Weight: 1 lb 4 oz.

Review:

These are my personal experiences with the unit. I was in search of
something to accomplish 3 basic purposes:

1: Reduce noise, to be able to listen to weak signals, and remove
interference from computers, power lines, etc.

2: To remove heterodynes, those annoying whines and squeals.

3: To remove adjacent frequency interference.... "bleedover"

Test Equipment:

CB Radio: Cobra 19 Plus
Shortwave Reveiver: Panasonic RF-B45 with supplied indoor longwire antenna.
Scanner: Bearcat BC-855 XLT

Noise Reduction:

CB: Alternator whine was _dramatically_ reduced. Ignition pops still were present, although reduced slightly. Some atmospheric noise was removed, although, not as much as I would have liked.
I'll give the unit a "B" here

Shortwave: computer interference was slightly reduced... not a lot. My computer, a Tandy Color Computer 3 is about the noisiest computer known to mankind... Your computer may or may not affect your reception. Atmospheric noise was cut somewhat, in some cases, enough to allow me to pull out stations not previously understood. Other noise, such as light dimmers, appliance, etc was reduced up to 50 percent. Sideband noise reduction was much better than on AM. Looks like a grade of "C" overall

Scanner: The unit did _wonders_ on FM... Certain 800 Mhz signals were cleaned up dramatically. On some systems, a high pitched whine is present. This whine was totally removed. Static noise was reduced, if not eliminated. My tests did not cover the AM aircraft band. A grade of "B" works for me.

Ratings: Scanner use won out... Then came a mobile CB, Shortwave SSB, and in last place SWL AM. In all cases the unit _did_ help, just some applications better than others. Overall I will give the unit a "C" in noise Reduction....

Heterodyne Reduction:

In _all_ applications the unit 75% of the time eliminated ALL whines. In the Remaining 25%, the whine was reduced to the point that the target signal was clearly understood. This unit is perfect for those plagued with heterodynes. I give the unit a definite "A+" for heterodyne reduction.

Adjacent Frequency Rejection:

In all cases, the unit either reduced this not at all, or moderately. Forget it if your primary needs are the elimination of "bleedover" On Shortwave SSB, it performed in some cases acceptable however. A "D" here.

Overall Evaluation:

Sound Quality is reduced with the unit's DSP function engaged. You have to lose some quality of sound in order for the unit to do its job. None of my applications require audiophile sound anyway.
Overall, the unit rates a "C" for me. It is not a "miracle cure" for the ills of radio reception. Neither is it a "dog". It helps, but does not turn a signal into a flawless, clean, pure audio signal.

These are my own personal evaluations, using the specific equipment I noted above. Others have given the unit _much_ better ratings than I have.

For the price, the unit, in my opinion _is_ worth it. You will find no unit anywhere similar for the price.

For the Technically Curious:

There is no schematic provided in the users manual. Also, I have not opened the unit to determine the components used. Reportedly, the main circuit board is shielded, making a quick look impossible. It could take a little work to view the guts of the system.
As the unit obviously uses some sort of program to do the job, future upgrades, could be possible by a chip change (my opinion only) to update the software.

I doubt if there is a kit - scanner circuitry is fairly complex.

However, you should be able to buy a scanner from radio shack that covers
the band - at a cost of less than $100.

3021. Has anyone cracked Uniden 9100 900MHz cordless phone?

Newsgroup: rec.radio.scanner
Date: 1994-04-24 08:29:23 UTC
From: mball@netcom.com
Message-ID: <mballCor8x0.GAs@netcom.com>
Source record: 275169

I lost track of the occasional discussions of scanning particular
models of 900MHz cordless phones. These kind of phones were hard to
find but I brought home the Uniden and AT&T 9120 to evaluate. I kept
the Uniden for stupid-consumer reasons I don't think I was able to make
a very good evaluation of the radio characteristics.

Both phones say "digital" only Uniden claims "spread spectrum". Any
way to tell? What scanners can receive it?

Anyone have experience with the less-pricey phones?
Was Tropez the brand with quality control problems and 450MHz harmonics?
Sony doesn't say "digital". Is it?
What about the Bell[South|North|East|West] phones?

Here's the scanner related hi-lites, like anyone cares:
- could not detect either phone with my BC200XLT using a 800MHz antenna
in the frequency range specified in the manual.
(900MHz on the 200XLT is full of images--cellular, TV--it's hard to
really tell if what you hear is actually transmitting at 900MHz)
- rubber ducky on 200XLT may have picked up AT&T, but the clutter was
even werse.
- don't have a freq counter.
- Uniden caused substantial interference with AT&T.

regards,
mark

>the job.

Get the service manual, an appointment with your opthalmologist, and have
a play. The circuit boards stand upright in a narrow cavity, and are
soldered in place at the bottom of that cavity.

The ultimate rejection of this model is limited as much by the cheap
filters as by reciprocal mixing of spurs from the noisy synthesizer.
That's why you get images of signals hundreds of KHz away from their real
frequency.

Does have any information on changing frequency of Motorola Spirit VHF Business band hand-helds.

There is a four position dip switch under the battery case that I suspect may change frequencies.

Because Motorola only charges $7.50, I can't believe they are doing anything but changing a switch or DIP jumper.

The thing I think is important to remember is that the little number
on the keys *will* wear off with normal use. The plastic case Yupiteru
sells will protect your radio from that. I think with them going for
more than $700 (grin) it is a good idea to protect your investment.
I wonder how much the crybabies will beg people to sell them for
in a month (see excerpted private email below).

"I bought the last R100 HRO had (it is my 2nd). They have no more 800 MHz
scanners or similar except Alinco amateur transcievers thagt receive such. EEB is
also dry, Both tell me they have fewer than expected because fed agencies,
especially DEA, bought out their stack on R7100 and bought others. These agencies are
trying to avoid the paperwaork and reduced availability of the new law.
Apparently the paperwork and delays caused by such are expected to be unpleasant."

Message-ID: <9404241428591.tedtrost.DLITE@delphi.com>
Source record: 275079

I used to live in Libertyville.

Lake County's fire frequencies split the county into 4 quadrants.

Libertyville, Mundelein, VH, Lake Bluff, etc. 154.430
Waukegan, Gurnee, Newport, Zion 154.325
Fireground 154.265
Antioch, Fox Lake, etc. 154.400
Barrington, Lake Zurich, Southwest communities 153.890

Keep in mind, however, that you may be hearing one-sided conversations
because the portables and mobiles are so weak that you can only hear the
bases. That is why the bases often repeat what the portable/mobile said
before they acknowledge.

Many people have uploaded files to the ham radio area on
oak.oakland.edu (/pub/hamradio/incoming).

But, what many have failed to do is e-mail me after the upload.

This presents at least two problems: 1) Notification in a timely manner,
resulting in a delay in access for others; 2) If anything is wrong with the
upload, I don't have anyone to contact for a retransfer.

What is the moral? If you upload a file to the FTP area, please let me know.

Thanks much.

73,
Scott

No problem, I'm the ranking editor of the "Donelan Dispatch." I'll just
sign my own press credentials.

In New Jersey, how do the state police decide who to issue press ID's too?
Would you be more or less likely to write a story critical of the New
Jersey state police if you knew they could revoke your press ID? If
"member of the press" means having a police issued press ID, does that
really mean "member of the press" is a term of art for "police
approved reporter?"

If the government gets to define what is considered the press, what does
that mean for idea of freedom of the press. Can the government shutdown
a reporter just by defining her not to be a member of the press.

don't look now, but your scoped 30-06 is now a "sniper rifle" and
your 12-gauge is the weapon of choice for criminals. both are far
more lethal than any "assault weapon".

"extremist" is nothing more than a perjorative, which can be applied
to you and your "hunting weapons" even more easily than it was to
those who own guns with black plastic stocks.

by the time they come for your hunting rifles, there won't be any
neighbors to stand "elbow to elbow" with. you'll learn the same
lesson pastor Niemoller did, but yours will be even more painful. he
simply didn't speak up for the demonized members of his society.

you actively helped.

3040. IDEA -Ultimate Scanner Summary to date

Newsgroup: rec.radio.scanner
Date: 1994-04-24 22:34:26 UTC
From: vhealey@crl.com
Message-ID: <2pes5i$pv5@crl2.crl.com>
Source record: 275102

Here are some of the ideas I have recieved regarding what would make
a better scanner design. If your idea is not listed either email me at
vhealey@crl.com or post to a usenet scanner area. Please preface
all ideas or followups with the keyword IDEA to allow for a fast
topic search when looking at mail or USENET threads.

Victor Healey Ki4je Internet: vhealey@crl.com
==========
This is a great thread. If we continue with our list of dream scanner
features (and someone listens) maybe we'll see some *really* cool, albeit
expensive, equipment in a year or so. Here are some of mine off of the top
of my head:

1) An activity alarm. I may want to program in a new frequency that I'm
unsure if it's in use and I'd love to have an "alarm" that would go off when
a certain channel shows some activity. That way I could go on with my
normal monitoring, but still notice if one of my new channels shows some
activity.

2) The data channel skip that Uniden has recently advertised. If it does
what it sounds like it should, it would make trunked system monitoring much
nicer.
--
Neil Weisenfeld, Computer Engineer Internet: weisen@alw.nih.gov
==========
Two features that I've been thinking about lately are:

1. Temporary lockout keys. Often a frequency that I scan has some noise on it
that stops scanning. I hate to hit lockout, since I know I'll forget about it
tomorrow. My idea would be to have a lockout button that only locks the
channel out for 10 minutes or some similar period. After the time is up, the
channel becomes unlocked automatically. If the interference is still there,
you can hit the button again.

2. Have a memory pool. Lets say you have 1000 channels. The user should be
able to assign the channels in the banks they want - they put in their own
dividers- i.e. ch 1 - 27 make bank 1, 27-200 make bank 2, etc. The user
selects how many channels go in each bank. You could have one bank of 1000, 2
banks of 500, or whatever you need in each bank. The banks could be selected
with softkeys - like the newer HP calculators. A key has an area on the
display that shows what the key function is (the user programs the alpha
characters). So the bank 1 key might say: LOCAL PD or FIRE. This way you can
select banks by name. My 2500XLT has 20 banks and I can't keep track in my
head.

Needles to say, good RF performance is a MUST. A scanner with lots of features is worthless if all you hear is intemod.

Brett Miller N7OLQ brett_miller@ccm.hf.intel.com

==========

Lets see if we can get two-tone sequential paging in scanners.

This option would give people who live in high traffic areas the capability of being alerted as to when it is a department near them as opposed to one across town.

If there is a scanner with such a feature I would like to know.

Eric Morrie em004b@uhura.cc.rochester.edu

==========

I'd like to see scanner manufacturers incorporate a "continuous loop" voice recorder in their high end models. It could employ digital voice storage ICs, which are already being sold on the open market (e.g., at Radio Shack and advertised by others in QST).

The solid state recorder would continously record the last minute or so of the audio played out the scanner's speaker.

If the phone rings or your spouse speaks to you at the same time your scanner is squawking, causing you to miss an important transmission, you could press a button on the scanner and replay the last minute or so of audio.

Copyright 1994, Bob Parnass, AJ9S

AT&T Bell Laboratories - parnass@ih4gp.att.com - (708)979-5414

==========

Good idea. But might it be a little less aggravating if the temperarily locked out channel stayed locked out untill the scanner was turned off. That way you wouldn't have to worry about forgetting to unlock the channel next time you turn on the unit, and if you want to unlock temp channels without cycling the power, a reset or lockout toggle button would be available.

Furthermore, a nifty little add-on to user definable bank sizes would be a "sort" button which would sort the channels in a bank by frequency in ascending or decending order. This may facillitate following trunked conversations, as well as passifying scanner freq perfectionists!

Steve Willingham swilling@ic1d.harris.com

==========

2. Have a memory pool. Lets say you have 1000 channels. The user should be able to assign the channels in the banks they want - they put in their own dividers- i.e. ch 1 - 27 make bank 1, 27-200 make bank 2, etc. The user selects how many channels go in each bank. You could have one bank of 1000, 2 banks of 500, or whatever you need in each bank. The banks could be selected with softkeys - like the newer HP calculators. A key has an area on the display that shows what the key function is (the user programs the alpha characters). So the bank 1 key might say: LOCAL PD or FIRE. This way you can select banks by name. My 2500XLT has 20 banks and I can't keep track in my head.

Needles to say, good RF performance is a MUST. A scanner with lots of features is worthless if all you hear is intemod.

From hammersch@aol.com Wed Apr 6 05:39:51 PDT 1994

But, since we are on the subject.... How about a scanner with a keyboard that you don't have to have 1mm wide fingers to operate??????

==========
1. Multiple priority settings - as most scanners are currently set up, you have ONE priority channel. On some scanners it is channel 1, on

The BC-200XLT does this. Although the priority channels are not programmable, the first channel of each bank is a priority channel. If all ten banks are turned on, you can see it stop scanning the main channels and scan the ten priority channels, then resume scanning the main channels.

Jacob DeGlopper, EMT-A, N3RHI jacob@mayhem.cwru.edu

From phn@dde.dk
Another feature I have often wanted is a better way of handling duplex channels i.e. channels where base and mobile stations transmit on different frequencies and no repeater is used.

As it is now, when traffic is handed over the scanner must immeadiately resume scanning (no delay) to catch the other channel. However if you have many channels programmed in, the scanner might stop on some other traffic and you miss the

reply.

The feature I want is some way of linking two channels together.
It might work something like this:

When traffic ceases on a linked channel, instead of resuming
normal scan the scanner should enter a special mode where it
only scans the two linked channels. This prevents it from
stopping on other traffic. If no traffic occurs on either
of the two linked channels for som time, say 5 seconds, the
scanner should resume normal operation.

This feature might also come in handy when listening to the
mobile part as this is often subject to signal dropout which
causes the scanner to resume scanning as delay cannot be used
for the reasom described above. Resuming scanning on only the
tow linked channels will make it stop again immediately on the
mobile channel.

A more general approch would be to allow any number of channels
to be linked together. This might prove useful when scanning
trunked systems.

From jackson@longlast.cs.nyu.edu

I've always thought that in a computer-controlled environment, monitoring
multiple frequencies simultaneously would be pretty cool. That is:

using an object oriented development system, "spawn" multiple one channel
scanners and program the frequency, mode, and ctcss into it. The computer
sorts all of the frequencies into modes and sequential order and dumps
them to the scanner (since scanners can change channels to contiguous freqs
more quickly) for scanning.

Whenever the scanner comes across a transmission, it sends the freq, mode,
signal strength, and a sound bite to the computer. The computer then plays
the sound bite, with a signal strength meter on the face of the scanner on
the screen that had that freq programmed into it.

With a fast enough scanner and computer (probably optimized Pentium), the
sound bites will be coming in fast enough that you could listen to several
channels seemingly simultaneously.

What makes one scanner stay one scanner is because when the scanner stops
on a transmission, it stays on it. If the scanner could send tiny segments
of the audio from several different channels and let the computer piece
the sound back together, one thread could distribute the sound bites to
other threads that individually piece the sound back together and play
them simultaneously.

You would probably need a fiber link from the scanner to the computer, like
the old (and probably new) top of the line music CD players.

Of course, if you spawn several scanners, the audio quality might drop. It's
like buying 400 crystal-controlled one channel scanners and turing them all
on at the same time.

From brett_miller@ccm.hf.intel.com

Sounds like you are talking about time division multiplexing. For maginal
audio quality you need to sample the source at least 2 times the highest audio
frequency, So lets say the highest voice frequency from your scanner is 3
KHz, your scanner would need to scan at a rate of 6000 channels per second!

That makes Unidens 300 ch/sec look pretty slow.

Brett Miller N7OLQ brett_miller@ccm.hf.intel.com
==

From strech1@aol.com

While I think I have most every scanner I need, I'm sure that if the mfr's came
up with a new style, I may be tempted to add to the collection. After all, we
can always use another scanner.....
What I'd like to have would be a scanner that does'nt look so much like a
scanner or cop radio. A 100 channel scanner, that is built just like a
'Walkman' would be a good addition to my collection. People get so wierd
sometimes when you have a scanner while walking or biking, or riding a bus.
Walkmans are a
common sight, and I'd rather listen to Comm Center any day instead of 'Rokkum
Hot 98fm', now put a tape deck along with it...Oh Joy!

==
From hak@alf.cooper.edu

The channel switching timing
is nasty, but not quite as bad as 1/6000 sec. Nyquist sampling is
based on impulse sampling. I think what is implied here would involve
longer spurts of audio, with gaps in between. I'm not sure what rates
would be needed for reasonable audio quality. Also, the ch/sec rating
of a conventional scanner has to include time at each channel for
the squelch to settle so the thing can decide whether to stop there.

ANother approach to the parallel scanner is to use several LO/Mixer
/If filter stages, then use a high-performance DSP to sample them
in parallel. Of course, you could just buy N scanners, set them each
to a single channel, and then sample the resulting audio out :)

--Neil

From ewhite@chop.isca.uiowa.edu

Is it time to bring back the single band scanner? The current philosophy seems to be a "one size fits all" radio capable of receiving DC to Daylight frequencies. But that also means compromises.

Many scanner users are only interested in one or two specific bands. For example, I listen almost exclusively to railroad frequencies. There isn't a single handheld on the market today that does a real good job on the RR freqs (159-162 Mhz). Well, maybe the Yupi MVT-7100, but that's a bit expensive for someone who's just listening to choo-choos.

I'd much rather have a tight front end, high sensitivity, and good intermod and image rejection in a 159-163 Mhz only rig. (Toss in the NOAA freqs since they're so close, and maybe expand it for Marine band users down to 156 Mhz). Yes, I'd like to keep all the handy features and fast scan speed of the latest GRE or Uniden radios as well. I'll continue to use my "one size fits all" scanner for the few things I need to listen to outside that band.

Eric

==========

From dmsmith@tacom-emh1.army.mil

Multiple antenna inputs, say two inputs one for your discone and one for your beam. These would be selectable while in manual mode, discone beam or both. Each channel could be programmed to automaticly select the best antenna for that frequency or direction of reception while scanning.

==========

From brett_miller@ccm.hf.intel.com

I agree. Wideband is synonimous with intermod. How about a scanner that has "plug-in" RF modules for different bands? The digital control stuff could be built in and the user could pop in the band module - complete with filters.

Brett Miller N7OLQ brett_miller@ccm.hf.intel.com
==========
from jerry@hnrc.tufts.edu
The way miniaturization is working, it may well be possible to stop the box from getting too large. If the idea is sound, there'll be some manufacturer who do it and charge a premium to those who appreciate the quality (or so I'd hope. Guess we need a class below novice . . . naive!)
==========

From jeh@cmkrnl.com

The most ambitious approach would be to rip out the entire microprocessor and memory and replace them with something new. Remember, tuning the scanner is a matter of applying the right voltages to varactor diodes, programming frequency synthesizers, and so on. This simply involves getting the right logic states out of the right pins on the uP at the right times. If the factory-supplied uP

can't be persuaded to emit a certain set of logic states at a certain set of times, it can be replaced with one that will. ("You can be replaced!")

Might as well add a bunch more features too. How about:

- built-in support for truly enormous memories

- adjustable bank limits

- selectable "bank sets" ("I want my virtual banks 1 through 10 to be physical banks 23, 2, 19, 45, ...")

- automatic search-and-store, recording number of hits on each frequency so stored

- channel pairs for repeater uplink/downlink pairs (when carrier drops on one channel of a pair, scanner automatically looks at the other half of the pair for the next signal, before reverting to general scan)

and, of course,

- a high-speed EIA232 port, designed in from the beginning, with provision for uploading and downloading channel memories, full control of scanner, full readout of scanner condition, etc., etc.

Hi All,
seeing the questions about prices of scanners, and radios
and the like in the States. I was wondering if any one could give me
a few Prices to compare with English prices. I hoping to get to the
states later this year, and I could do with some bits and pieces
for the shack. I'm interested in the larger AOR scanners particularly.
The other thing I was wondering about, was how much a Pentium p60
is over there. They are about the 3000 pounds here.
I'd like one, but think I'd have to mortgage the cat to be get one.
{Still who knows one day they might become affordable.}

bfn
And thanks for your time.

In Ontario it's legal to buy, own or use a radar detector, unfortunately it is against the Highway Traffic Act for it to be in a vehicle (even if it,s not being used)

So strictly speaking it's not illegal to "listen"
